**Modern Control System Theory** M. Gopal, 1993 About the book The book provides an integrated treatment of continuous time and discrete time systems for two courses at postgraduate level or one course at undergraduate and one course at postgraduate level It covers mainly two areas of modern control theory namely system theory and multivariable and optimal control The coverage of the former is quite exhaustive while that of latter is adequate with significant provision of the necessary topics that enables a research student to comprehend various technical papers The stress is on interdisciplinary nature of the subject Practical control problems from various engineering disciplines have been drawn to illustrate the potential concepts Most of the theoretical results have been presented in a manner suitable for digital computer programming along with the necessary algorithms for numerical computations

Modern Control Systems Engineering Zoran Gajic, Zoran Gajić, M. Lelić, 1996 The book represents a modern treatment of classical control theory and application concepts Theoretically it is based on the state space approach where the main concepts have been derived using only the knowledge from a first course in linear algebra Practically it is based on the MATLAB package for computer aided control system design so that the presentation of the design techniques is simplified The inclusion of MATLAB allows deeper insights into the dynamical behaviour of real physical control systems which are quite often of high dimensions Continuous time and discrete time control systems are treated simultaneously with a slight emphasis on the continuous time systems especially in the area of controller design Instructor's

Manual 0 13 264730 3      Modern Control Engineering Kp Mohandas, 2008-01-01 The book is divided into ten chapters with the first chapter being a very brief introduction to classical control theory The second chapter gives the classical design techniques using Bode plots and root locus technique Analysis of discrete time systems is presented in Chapter 3 using z transforms Chapter 4 5 and 6 deal with state space modelling solution of state equation and design of control systems using state space model with a glimpse on the design of observers and state feed back controller Chapter 7 and 8 deal with nonlinear systems the former on phase plane analysis and the latter on describing function method Even though both these methods were developed long time back these methods are still useful to get some insight into the behaviour of nonlinear systems Chapter 9 discusses in depth the Lyapunov s method for stability analysis of systems and Chapter 10 is a brief introduction to concepts and methods of optimal control Several worked examples and a summary points to remember have been added in each chapter A set of multiple choice questions has been added at the end of the book which is useful for students in the preparation of objective type tests An introduction to the MATLAB software package is given in Appendix
