

WIND

6.6% global electricity generation (2021)

Wind flows over the blades of a wind turbine, creating mechanical power by turning the blades.

The blades are connected to a drive shaft that turns an electric generator to produce electricity.

SOLAR

3.7% global electricity generation (2021)

Photovoltaic (PV) cells contain thin semiconductor wafers, forming an electric field.

When light hits the cell, electrons are knocked loose from the semiconductor material and move in response to the electric field.

This generates electricity, transferred through metal conductors on the PV cell.

Biomass is burned in a boiler to produce steam.

Steam rotates the blades of a turbine connected to a generator that produces electricity.

Biomass can also be converted into other liquid or gaseous fuels used to generate electricity.

GEO THERMAL

<1% global electricity generation (2021)

As the water reaches the surface, it boils over into steam, which rotates a steam turbine.

The turbine is connected to a generator that produces electricity.

Hot water from underground reservoirs is pumped using pipes or wells.

Dams or other diversion structures alter the natural flow of water to increase its elevation and volume.

Water flows through the dam, generating mechanical energy that spins a turbine connected to an electric generator.

Renewable Energy , **The Renewable Energy Alternative** John O. Blackburn, 1987 Energy supply problems for the long run have not been solved according to John Blackburn and they will reappear when the present temporary glut in the oil market ends Now is the time Blackburn argues to plan an orderly transition to a sustainable energy future before another crisis looms **Annual Energy Outlook 1998: With Projections to 2020** , 2001 The Annual Energy Outlook 1998 AEO98 is the first AEO with projections to 2020 Key issues for the forecast extension are trends in energy efficiency improvements the effects of increasing production and productivity improvements on energy prices and the reduction in nuclear generating capacity Projections in AEO98 also reflect a greater shift to electricity market restructuring Restructuring is addressed through several changes that are assumed to occur in the industry including a shorter capital recovery period for capacity expansion decisions and a revised financial structure that features a higher cost of capital as the result of higher competitive risk Both assumptions tend to favor less capital intensive generation technologies such as natural gas over coal or baseload renewable technologies The forecasts include specific restructuring plans in those regions that have announced plans California New York and New England are assumed to begin competitive pricing in 1998 The provisions of the California legislation for stranded cost recovery and price caps are incorporated In New York and New England stranded cost recovery is assumed to be phased out by 2008 *Advancement in Materials, Manufacturing and Energy Engineering, Vol. II* Puneet Verma, Olusegun D. [The Economic Superorganism](#) Carey W. King, 2020-10-07 Energy drives the economy economics informs policy and policy affects social outcomes Since the oil crises of the 1970s pundits have debated the validity of this sequence but most economists and politicians still ignore it Thus they delude the public about the underlying influence of energy costs and constraints on economic policies that address such pressing contemporary issues as income inequality growth debt and climate change To understand why Carey King explores the scientific and rhetorical basis of the competing narratives both within and between energy technology and economics Energy and economic discourse seems to mirror Newton s 3rd Law of Motion For every narrative there is an equal and opposite counter narrative The competing energy narratives pit drill baby drill against renewable technologies such as wind and solar Both claim to provide secure reliable clean and affordable energy to support economic growth with the most benefit to society but how To answer this question we need to understand the competing economic narratives techno optimism and techno realism Techno optimism claims that innovation overcomes any physical resource constraints and enables the social outcomes and economic growth we desire Techno realism in contrast states that no matter what energy technologies we use feedbacks from physical growth on a finite planet constrain economic growth and create an uneven distribution of social impacts In *The Economic Superorganism* you will discover stories data science and philosophy to guide you through the arguments from competing narratives on energy growth and policy You will

be able to distinguish the technically possible from the socially viable and understand how our future depends on this distinction
