Representations of Multiple-Valued Logic Functions Radomir S. Stankovic, Jaakko Astola, Claudio Moraga, 2022-06-01 Compared to binary switching functions the multiple valued functions MV offer more compact representations of the information content of signals modeled by logic functions and therefore their use fits very well in the general settings of data compression attempts and approaches The first task in dealing with such signals is to provide mathematical methods for their representation in a way that will make their application in practice feasible Representation of Multiple Valued Logic Functions is aimed at providing an accessible introduction to these mathematical techniques that are necessary for application of related implementation methods and tools This book presents in a uniform way different representations of multiple valued logic functions including functional expressions spectral representations on

finite Abelian groups and their graphical counterparts various related decision diagrams Three valued or ternary functions are traditionally used as the first extension from the binary case They have a good feature that the ratio between the number of bits and the number of different values that can be encoded with the specified number of bits is favourable for ternary functions Four valued functions also called quaternary functions are particularly attractive since in practical realization within today prevalent binary circuits environment they may be easy coded by binary values and realized with two stable state circuits At the same time there is much more considerable advent in design of four valued logic circuits than for other p valued functions Therefore this book is written using a hands on approach such that after introducing the general and necessarily abstract background theory the presentation is based on a large number of examples for ternary and quaternary functions that should provide an intuitive understanding of various representation methods and the interconnections among them Table of Contents Multiple Valued Logic Functions Functional Expressions for Multiple Valued Functions Spectral Representations of Multiple Valued Functions Decision Diagrams for Multiple Valued Functions Fast Calculation Algorithms

Discrete Function Representations Utilizing Decision Diagrams and Spectral Techniques Whitney Jeanne Townsend, 2002 All discrete function representations become exponential in size in the worst case Binary decision diagrams have become a common method of representing discrete functions in computer aided design applications For many functions binary decision diagrams do provide compact representations This work presents a way to represent large decision diagrams as multiple smaller partial binary decision diagrams In the Boolean domain each truth table entry consisting of a Boolean value only provides local information about a function at that point in the Boolean space Partial binary decision diagrams thus result in the loss of information for a portion of the Boolean space If the function were represented in the spectral domain however each integer valued coefficient would contain some global information about the function This work also explores spectral representations of discrete functions including the implementation of a method for transforming circuits from netlist representations directly into spectral decision diagrams *Spectral Logic and Its Applications for the Design of Digital Devices* Mark G. Karpovsky, Radomir S. Stankovic, Jaakko T. Astola, 2008-04-15 Spectral techniques facilitate the design and testing of today's increasingly complex digital devices There is heightened interest in spectral techniques for the design of digital devices dictated by ever increasing demands on technology that often cannot be met by classical approaches Spectral methods provide a uniform and consistent theoretic environment for recent achievements in this area which appear divergent in many other approaches Spectral Logic and Its Applications for the Design of Digital Devices gives readers a foundation for further exploration of abstract harmonic analysis over finite groups in the analysis design and testing of digital devices After an introduction this book provides the essential mathematical background for discussing spectral methods It then delves into spectral logic and its applications covering Walsh Haar arithmetic transform Reed Muller transform for binary valued functions and Vilenkin Chrestenson transform generalized Haar and other related transforms for multiple

valued functions Polynomial expressions and decision diagram representations for switching and multiple value functions Spectral analysis of Boolean functions Spectral synthesis and optimization of combinational and sequential devices Spectral methods in analysis and synthesis of reliable devices Spectral techniques for testing computer hardware This is the authoritative reference for computer science and engineering professionals and researchers with an interest in spectral methods of representing discrete functions and related applications in the design and testing of digital devices It is also an excellent text for graduate students in courses covering spectral logic and its applications **Discrete Function**

Representation of Lie Groups and Special Functions Naum I. Akhiezer, A. U. Klimyk, 1991-11-30
 This is the first of three major volumes which present a comprehensive treatment of the theory of the main classes of special functions from the point of view of the theory of group representations
 This volume deals with the properties of classical orthogonal polynomials and special functions which are related to representations of groups of matrices of second order and of groups of triangular matrices of third order
 This material forms the basis of many results concerning classical special functions such as Bessel MacDonald Hankel Whittaker hypergeometric and confluent hypergeometric functions and different classes of orthogonal polynomials including those having a discrete variable
 Many new results are given
 The volume is self contained since an introductory section presents basic required material from algebra topology functional analysis and group theory
 For research mathematicians physicists and engineers

Fourier Analysis on Finite Groups with Applications in Signal Processing and System Design Radomir S. Stankovic, Claudio Moraga, Jaakko Astola, 2005-08-08
 Discover applications of Fourier analysis on finite non Abelian groups
 The majority of publications in spectral techniques consider Fourier transform on Abelian groups
 However non Abelian groups provide notable advantages in efficient implementations of spectral methods
 Fourier Analysis on Finite Groups with Applications in Signal Processing and System Design examines aspects of Fourier analysis on finite non Abelian groups and discusses different methods used to determine compact representations for discrete functions providing for their efficient realizations and related applications
 Switching functions are included as an example of discrete functions in engineering practice
 Additionally consideration is given to the polynomial expressions and decision diagrams defined in terms of Fourier transform on finite non Abelian groups
 A solid foundation of this complex topic is provided by beginning with a review of signals and their mathematical models and Fourier analysis
 Next the book examines recent achievements and discoveries in Matrix interpretation of the fast Fourier transform
 Optimization of decision diagrams
 Functional expressions on quaternion groups
 Gibbs derivatives on finite groups
 Linear systems on finite non Abelian groups
 Hilbert transform on finite groups
 Among the highlights is an in depth coverage of applications of abstract harmonic analysis on finite non Abelian groups in compact representations of discrete functions and related tasks in signal processing and system design including logic design
 All chapters are self contained each with a list of references to facilitate the development of specialized courses or self study
 With nearly 100 illustrative figures and fifty tables

this is an excellent textbook for graduate level students and researchers in signal processing logic design and system theory as well as the more general topics of computer science and applied mathematics

Automorphic Representations and L-Functions for the General Linear Group: Volume 2 Dorian Goldfeld, Joseph Hundley, 2011-04-21 This graduate level textbook provides an elementary exposition of the theory of automorphic representations and L functions for the general linear group in an adelic setting Definitions are kept to a minimum and repeated when reintroduced so that the book is accessible from any entry point and with no prior knowledge of representation theory The book includes concrete examples of global and local representations of GL_n and presents their associated L functions In Volume 1 the theory is developed from first principles for GL_1 then carefully extended to GL_2 with complete detailed proofs of key theorems Several proofs are presented for the first time including Jacquet's simple and elegant proof of the tensor product theorem In Volume 2 the higher rank situation of GL_n is given a detailed treatment Containing numerous exercises by Xander Faber this book will motivate students and researchers to begin working in this fertile field of research

Automorphic Forms, Representations and L-Functions A. Borel, W. Casselman, 1979 Contains sections on Reductive groups representations Automorphic forms and representations

Emerging Applications of Number Theory Dennis A. Hejhal, 1999-05-21 Most people tend to view number theory as the very paradigm of pure mathematics With the advent of computers however number theory has been finding an increasing number of applications in practical settings such as in cryptography random number generation coding theory and even concert hall acoustics Yet other applications are still emerging providing number theorists with some major new areas of opportunity The 1996 IMA summer program on Emerging Applications of Number Theory was aimed at stimulating further work with some of these newest and most attractive applications Concentration was on number theory's recent links with a wide phenomena in quantum mechanics more specifically quantum chaos and b graph theory especially expander graphs and related spectral theory This volume contains the contributed papers from that meeting and will be of interest to anyone intrigued by novel applications of modern number theoretical techniques

Generalized Functions, Volume 6 I. M. Gelfand, M. I. Graev, I. I. Pyatetskii-Shapiro, 2016-04-19 The first systematic theory of generalized functions also known as distributions was created in the early 1950s although some aspects were developed much earlier most notably in the definition of the Green's function in mathematics and in the work of Paul Dirac on quantum electrodynamics in physics The six volume collection Generalized Functions written by I M Gelfand and co authors and published in Russian between 1958 and 1966 gives an introduction to generalized functions and presents various applications to analysis PDE stochastic processes and representation theory The unifying theme of Volume 6 is the study of representations of the general linear group of order two over various fields and rings of number theoretic nature most importantly over local fields p adic fields and fields of power series over finite fields and over the ring of adèles Representation theory of the latter group naturally leads to the study of automorphic functions and related number theoretic

problems The book contains a wealth of information about discrete subgroups and automorphic representations and can be used both as a very good introduction to the subject and as a valuable reference

Integral Geometry and Representation Theory I. M. Gel'fand, M. I. Graev, N. Ya. Vilenkin, 2014-05-12 Generalized Functions Volume 5 Integral Geometry and Representation Theory is devoted to the theory of representations focusing on the group of two dimensional complex matrices of determinant one This book emphasizes that the theory of representations is a good example of the use of algebraic and geometric methods in functional analysis in which transformations are performed not on the points of a space but on the functions defined on it The topics discussed include Radon transform on a real affine space integral transforms in the complex domain and representations of the group of complex unimodular matrices in two dimensions The properties of the Fourier transform on G integral geometry in a space of constant curvature harmonic analysis on spaces homogeneous with respect to the Lorentz Group and invariance under translation and dilation are also described This volume is suitable for mathematicians specialists and students learning integral geometry and representation theory
