Resealed Erythrocytes As Carriers And Bioreactors:

The Use of Resealed Erythrocytes as Carriers and Bioreactors Mauro Magnani, John R. DeLoach, 2012-12-06 Until recently the only biomedical use of erythrocytes was in transfusion medicine to restore a normal oxygen delivery. The development of a technology that permits one to open and reseal erythrocytes has dramatically changed this perspective. Currently a number of teams have shown that engineered erythrocytes can behave as circulating bioreactors for the degradation of toxic metabolites or the inactivation of xenobiotics as drug delivery systems as carriers of antigens of vaccinal interest and in many others biomedical applications. The technology of opening and resealing the erythrocytes has also been used successfully to investigate several basic aspects of erythrocyte metabolism, survival, pathology, etc. Thus researchers in this field have an extraordinary opportunity to specifically modify the erythrocytes by the introduction of enzymes that generate new metabolic abilities, antibodies that inactivate single metabolic steps or metabolites that can influence oxygen delivery and/or other cell properties. Furthermore, the pharmacokinetics of any drug can be potentially manipulated by using the erythrocytes as a delivery system. This book, The Use of Resealed Erythrocytes, is based on the fourth meeting of the International Society for the Use of Resealed Erythrocytes as Carriers and Bioreactors (ISURE) held in Urbino, Italy, in 1991 and examines the most recent applications and developments of this technology.

Erythrocytes as Drug Carriers in Medicine Ulrich Sprandel, James L. Way, 2013-06-29 The sixth meeting on the use of resealed annealed red blood cells was held in Irsee, Germany, by the International Society for the Use of Resealed Erythrocytes (ISURE) on July 25-28, 1996. Although earlier meetings focused on the technology toward development of methods and standardization for efficient consistent encapsulation, most of the present studies now are directed toward the application use of these carrier blood cells. Basic studies now have been directed toward exploration of commercial applications. Indeed, clinical trials were initiated to evaluate the dose response curves employing L-asparaginase in human patients. Also, studies have shown the use of thrombolytic agent in erythrocyte carriers with the use of human red blood cells to provide a new conceptual approach in thrombolytic therapy to prevent thrombosis in individuals with higher risk factors. For example, with the use of carrier red blood cells, the thrombolytic agents will have a greater potential of acting on clot formation without systemic activation and thus lower the risk of hemorrhage, which is always prevalent in the thrombolytic therapy.
