Abstract

Technologies and approaches in the field of Electronic Commerce are not mature enough in order to allow for their broad successful commercial application. Neither existing, successful approaches that are very much restricted to large companies, specific branches, and business domains, nor approaches just merging new technologies like Internet, WWW, and XML allow for scaling up electronic commerce by means of arbitrarily high numbers of partners. All these approaches lack substantial reflection and integration of business semantics as the basis of any electronic commerce partnership. ebXML is a world-wide initiative that tries to address the drawbacks of existing standards and approaches and has the potential to successfully deliver solutions to these problems. In this paper we address the status of ebXML and identify open research issues to be solved in order to meet some of the obstacles on the way of a commercial application of ebXML.

1. Introduction

The field of Electronic Commerce obviously can be seen from different perspectives, including the following viewpoints:

One can perceive the field as a hype of new, not very well-understood approaches for doing business electronically, which generated the (timely limited) age of the .com New Economy. In this viewpoint one may come up with the simplified, data-centric formula: *Internet + WWW + XML + some XML vocabulary + some new business model = the new way of doing business*. Approaches that are based on this model are for example BizTalk [15], OAG [17], cXML [1]. Observing the performance of the New Economy recently it looks like that this model to some extent lacks some substantial components in order to be applied successfully by commercial means.

Given the fact that commercially successfully implemented standards like ANSI X12 (since 1979), EDIFACT (since 1987), and SWIFT (since 1973) for exchanging data to do business have already been

established long time ago, the field of Electronic Commerce could be seen as an area of nothing spectacular new, but as a remake of approaches trying to merge new technologies in order to scale up by means of businesses being able to participate in ad-hoc networks of partners performing business electronically. The simplified, data-centric formula for this could be: *EDIFACT concepts + XML + Internet + adapted existing business models = the new way of doing business*. In this model the only new aspect seems to be XML, a new way of organizing data compared to the way of organizing data by EDIFACT. A prominent example of such an approach is xCBL [2, 16] which is based on EDIFACT and ANSI X12. In 1999, due to the growing popularity of XML, United Nations Centre for Trade Facilitation and Electronic Business (UN/CEFACT) also started to look for an XML solution which should be compatible with existing EDIFACT to protect the huge investments taken world-wide.

UN/CEFACT's Techniques and Methodology Working Group (TMWG) was responsible for doing a feasibility study on using XML for B2B information transfer. The TMWG report on this subject rejected the idea of creating 'Yet Another XML Solution' by converting EDIFACT to XML. This decision was mainly based on the fact that a syntactical transformation would hardly solve any EDI problem, but would just add another e-business vocabulary to the XML world.

Following up data-centric approaches mentioned above one can identify approaches trying to include or focusing on process-centric methods, i.e. business processes are becoming a central focus of Electronic Commerce models. Examples of this model are RosettaNet [18] and Open-edi [13]. In fact, the TMWG report mentioned above actually recommended to build up on the Open-edi reference model by using business process modeling to define the business aspects and by using XML as key concept for the technological aspects of e-business transactions. Additionally, TMWG suggested to cooperate in the development of the solution with the IT-industry to combine UN/CEFACT's business know-how with the experience of leading XML experts. The steering committee of UN/CEFACT accepted the TMWG recommendation and found an IT-partner in the Organization for the Advancement of Structured Information Standards (OASIS) that shares the goal of
