Abstract

This study describes the use of gas chromatography/mass spectrometry with selected ion monitoring to screen 18 anabolic steroids banned by the International Olympic Committee. These anabolic steroids are analyzed in two fractions depending on their excretion pattern: nonconjugated (free) or conjugated fraction. The wet procedure of extracting steroids from urine consists of an initial isolation of lipophilic compounds on a column packed with Amberlite XAD-2 resin, followed by enzymatic hydrolysis with β -glucuronidase from *Escherichia coli*. After extraction, the hydrolyzed steroids are derivatized to the corresponding trimethylsilyl ethers. The derivatized steroids are analyzed by gas chromatography/mass spectrometry with selected ion monitoring of their characteristic ions. It takes 12 and 26 min to run GC/MS and edit the raw data for nonconjugated and conjugated fractions respectively.

Introduction

In 1974, steroids were added to the list of doping agents banned by the International Olympic Committee on the grounds that drug abuse is against the Olympic spirit based on fair play, and also it is known that steroid abuse will harm the well-being of athletes. Nevertheless, it is suspected that the use of steroids has been steadily increasing among the players, who believe that the use of steroids improves their physical strength remarkably over a short period of time and who are willing to barter their health for fame and monetary gain. Precise and rapid determination of anabolic steroids and their metabolites continues to be of interest.

Some steroids can be analyzed with high-performance liquid chromatography (HPLC) (1-5), and it has been possible to detect 17 α -methyl, 17 α -ethyl, and 19-nortestosterone steroids by radioimmunoassay (RIA) despite the method's low specificity (6-9). However, both of these methods cannot provide the data necessary to confirm a presumptive positive sample. Therefore, gas chromatography/mass spectrometry (GC/MS) with high sensitivity and specificity has been regarded as the most reliable technique so far. In many cases, GC/MS has been used to

analyze the steroids either qualitatively or quantitatively (10-23).

Anabolic steroids are extensively metabolized: hydroxylation, reduction, oxidation, and conjugation are common metabolic pathways of anabolic steroids in humans. As far as conjugation patterns are concerned, steroids can be divided into two groups, nonconjugated (free) steroid and conjugated steroid. Dosáček reported that methandienone, oxandrolone, fluoxymesterone, stanozolol, dehydrochloromethyltestosterone, and formyldecaalone can be detected somewhat easily in the nonconjugated fraction. These anabolic steroids have a 17 β -hydroxy-17 α -methyl group in their structure (Figure 1). The other anabolic steroids whose structures are shown in Figure 2 are excreted mainly as glucuronides.

Materials

Reagents. Amberlite XAD-2 resin, 150-200 μ m, from Serva was used. Methanol (500 mL) was distilled at 64°C; the first 50 mL was discarded and the next 300 mL was collected. The phosphate buffer, pH 7.0, was 250 mL of 0.2M K_2HPO_4 mixed with 50 mL of 0.2M KH_2PO_4 . Diethylether was distilled with calcium hydride and stored in a refrigerator at ca. 1°C. β -Glucuronidase from *Escherichia coli* was from Boehringer. *N*-methyl-*N*-trimethylsilyl trifluoroacetamide (MSTFA), trimethylchlorosilane (TMSi), and trimethylchlorosilane (TMSCl) were from Sigma, and *N*-methyl-*N*-trimethylsilyl heptafluorobutyramide (MSHFB) and *N*-methyl-bisheptafluorobutyramide were from Macherey-Nagel.

Instrumentation. Analyses were performed with a Hewlett-Packard Model 5890A gas chromatograph and Model 5970B mass selective detector.

GC/MS operating conditions for nonconjugated fraction. A cross-linked 5% phenylmethylsilicone capillary column (length 17 m, i.d. 0.2 mm, film thickness 0.33 μ m) was connected into the ion source. Samples were injected in the splitless mode. Temperatures of injector and transfer line were set at 300°C. Oven temperature was initially 180°C, ramped by 25°C/min to 300°C, and held for 3 min. The carrier gas was helium at a flow rate of 0.7 mL/min (at 180°C).

GC/MS operating conditions for conjugated fraction. The GC was equipped with a 17-m HP-1 fused-silica capillary column, 0.2 mm i.d., 0.11- μ m film thickness. The oven temperature was

Steroids Hassan Abduljabbar, 2012-01-11 This book explains the basic

science of steroids and is targeted towards professionals engaged in health services. It should be noted that medical science evolves rapidly and some information like the understanding of steroids and their therapeutic use may change with new concepts quickly. Steroids are either naturally occurring or synthetic fat soluble organic compounds. They are found in plants, animals and fungi. They mediate a very diverse set of biological responses. The most widespread steroid in the body is cholesterol, an essential component of cell membranes and the starting point for the synthesis of other steroids. Since the science of steroids has an enormous scope, we decided to put the clinical aspects of steroids in a different book titled *Steroids Clinical Aspects*. The two books complete each other. We hope that the reader will gain valuable information from both books and enrich their knowledge about this fascinating topic.

Testicular Tangrams Focko Rommerts, K.J. Teerds, 2002-04-03. During the past two decades research on the testis has created a vast number of publications. New techniques such as cell and gene cloning, germ cell manipulation and transplantation as well as gene expression have surpassed the classical approaches that involved studies on receptor activation and endocrine, paracrine and autocrine regulatory mechanisms. Due to the expansion of this field of research it has become increasingly difficult to integrate the large number of observations and relate them to the physiology and pathophysiology of the testis. More emphasis must therefore be put on the integration of isolated findings and the construction of the total picture. In order to stimulate this specific mental activity we have named this book *Testicular Tangrams*. We hope that the chapters in this book will be used as pieces of the testicular puzzle and that the reader enjoys composing new shapes. The chapters of this book are representative of the plenary lectures presented at the 11th European Workshop on Molecular and Cellular Endocrinology of the Testis held in Doorwerth, The Netherlands from April 6-10, 2002. Publication of this book has been made possible by the generous support of the Ernst Schering Research

Foundation We would also like to thank the distinguished scientists who have provided us with their excellent manuscripts well before the start of the Workshop We acknowledge the help of Dr U F Habenicht Dr M
