Routing, Flow, and Capacity Design in Communication and Computer Networks Michal Pioro, Deep Medhi, 2004-07-21 In network design the gap between theory and practice is woefully broad This book narrows it comprehensively and critically examining current network design models and methods You will learn where mathematical modeling and algorithmic optimization have been under utilized At the opposite extreme you will learn where they tend to fail to contribute to the twin goals of network efficiency and cost savings Most of all you will learn precisely how to tailor theoretical models to make them as useful as possible in practice Throughout the authors focus on the traffic demands encountered in the real world of network design Their generic approach however allows problem formulations and solutions to be applied across the board to virtually any type of backbone communication or computer network For beginners this book is an excellent introduction For seasoned professionals it provides immediate solutions and a strong foundation for further advances in the use of mathematical modeling for network design Written by leading researchers with a combined 40 years of industrial and academic network design experience Considers the development of design models for different technologies including TCP IP IDN MPLS ATM SONET SDH and WDM Discusses recent topics such as shortest path routing and fair bandwidth assignment in IP MPLS networks Addresses proper multi layer modeling across network layers using different technologies for example IP over ATM over SONET IP over WDM and IDN over SONET Covers restoration oriented design methods that allow recovery from failures of large capacity transport links and transit nodes Presents at the end of each chapter exercises useful to both students and practitioners

Optimization of Computer Networks Pablo Pavón Mariño,2016-05-02 This book covers the design and optimization of

computer networks applying a rigorous optimization methodology applicable to any network technology. It is organized into two parts. In Part 1, the reader will learn how to model network problems appearing in computer networks as optimization programs and use optimization theory to give insights on them. Four problem types are addressed systematically: traffic routing, capacity dimensioning, congestion control, and topology design. Part 2 targets the design of algorithms that solve network problems like the ones modeled in Part 1. Two main approaches are addressed: gradient-like algorithms inspiring distributed network protocols that dynamically adapt to the network, or cross-layer schemes that coordinate the cooperation among protocols, and those focusing on the design of heuristic algorithms for long-term static network design and planning problems. Following a hands-on approach, the reader will have access to a large set of examples in real-life technologies like IP, wireless, and optical networks. Implementations of models and algorithms will be available in the open-source Net2Plan tool, from which the user will be able to see how the lessons learned take real form in algorithms and reuse or execute them to obtain numerical solutions. An accompanying link to the author's own Net2plan software enables readers to produce numerical solutions to a multitude of real-life problems in computer networks. Provisioning, Recovery, and In-Operation Planning in Elastic Optical Networks Luis Velasco, Marc Ruiz, 2017-09-01. Explains the importance of Elastic Optical Networks (EONs) and how they can be implemented by the world's carriers. This book discusses Elastic Optical Networks (EONs) from an operational perspective. It presents algorithms that are suitable for real-time operation and includes experimental results to further demonstrate the feasibility of the approaches discussed. It covers practical issues such as provisioning, protection, and defragmentation. It also presents provisioning and recovery in single-layer elastic optical networks (EON). The authors review algorithms for provisioning point-to-point, anycast, and multicast connections, as well as transfer-based connections for datacenter interconnection. They also include algorithms for recovery connections from failures in the optical layer and in-operation planning algorithms for EONs. Provisioning, Recovery, and In-operation Planning in Elastic Optical Network also examines multi-layer scenarios. It covers virtual network topology reconfiguration and multi-layer recovery and includes provisioning customer virtual networks and the use of data analytics in order to bring cognition to the network. In addition, the book presents managing connections dynamically and the flexibility to adapt the connection bitrate to the traffic needs, fit well for new types of services such as datacenter interconnection and Network Function Virtualization (NFV). Examines the topic in a holistic and comprehensive way, addressing control and management plane issues for provisioning, recovery, and in-operation planning. Covers provisioning, recovery, and in-operation planning for EONs at the proposed exhaustive level. The rapid expansion of new services has made the use of EONs a relatively new concept, a necessity. That's why this book is perfect for students and researchers in the field of technologies for optical networks, specifically EONs, including network architectures and planning, dynamic connection provisioning, on-line network re-optimization, and control and management planes. It is also an important text for engineers and practitioners working for telecom networks.

## **Internet Multimedia**

**Communications Using SIP** Rogelio Martinez Perea, 2008-02-27 Session Initiation Protocol SIP was conceived in 1996 as a signaling protocol for inviting users to multimedia conferences. With this development the next big Internet revolution silently started. That was the revolution which would end up converting the Internet into a total communication system which would allow people to talk to each other, see each other, work collaboratively or send messages in real time. Internet telephony and in general Internet multimedia is the new revolution today and SIP is the key protocol which allows this revolution to grow. The book explains in tutorial fashion the underlying technologies that enable real time IP multimedia communication services in the Internet: voice, video, presence, instant messaging, online picture sharing, white boarding, etc. Focus is on session initiation protocol SIP but also covers session description protocol SDP, Real time transport protocol RTP and message session relay protocol MSRP. In addition it will also touch on other application related protocols and refer to the latest research work in IETF and 3GPP about these topics. 3GPP stands for third generation partnership project which is a collaboration agreement between ETSI Europe, ARIB TTC Japan, CCSA China, ATIS North America and TTA South Korea. The book includes discussion of leading edge theory which is key to really understanding the technology, accompanied by Java examples that illustrate the theoretical concepts. Throughout the book in addition to the code snippets the reader is guided to build a simple but functional IP soft phone, therefore demonstrating the theory with practical examples. This book covers IP multimedia from both a theoretical and practical point of view, focusing on letting the reader understand the concepts and put them into practice using Java. It includes lots of drawings, protocol diagrams, UML sequence diagrams and code snippets that allow the reader to rapidly understand the concepts. Focus on HOW multimedia communications over the Internet work to allow readers to really understand and implement the technology. Explains how SIP works including many programming examples so the reader can understand abstract concepts like SIP dialogs, SIP transactions, etc. It is not focused on just VoIP. It looks at a wide array of enhanced communication services related to SIP, enabling the reader to put this technology into practice. Includes nearly 100 references to the latest standards and working group activities in the IETF, bringing the reader completely up to date. Provides a step by step tutorial on how to build a basic though functional IP soft phone, allowing the reader to put concepts into practice. For advanced readers the book also explains how to build a SIP proxy and a SIP registrar to enhance one's expertise and marketability in this fast moving area.
