Nano Mechanics and Materials Wing Kam Liu, Eduard G. Karpov, Harold S. Park, 2006-08-30 Nanotechnology is a progressive research and development topic with large amounts of venture capital and government funding being invested worldwide Nano mechanics in particular is the study and characterization of the mechanical behaviour of individual atoms systems and structures in response to various types of forces and loading conditions This text written by respected researchers in the field informs researchers and practitioners about the fundamental concepts in nano mechanics and materials focusing on their modelling via multiple scale methods and techniques The book systematically covers the theory behind multi particle and nanoscale systems introduces multiple scale methods and finally looks at contemporary applications in nano structured and bio inspired materials

Nano Mechanics and Materials Wing Kam Liu, Eduard Karpov, Harold Park, 2005-09-01 The exponential increase in transistor density on computer chips supporting Moore's law now for four decades poses new design challenges to engineers and computer scientists alike New techniques for managing complexity must be developed if circuits are to take full advantage of the vast numbers of transistors available This book investigates both the design of high level languages for hardware description and techniques involved in translating these high level languages to silicon The author introduces the first order functional language SAFL designed specifically for behavioral hardware description and describes the implementation of its associated silicon compiler Finally the SAFL language is extended with pi calculus style channels and channel passing and primitives for structural level circuit description The semantics of these languages is formalized and results are presented arising from the generation of real hardware exploiting these techniques This monograph is based on the author's PhD work conducted at the Computer Laboratory of the University of Cambridge UK under the supervision of Dr Alan Mycroft

Nanomaterials K.T. Ramesh, 2009-06-12 This book grew out of my desire to understand the mechanics of nanomaterials and to be able to rationalize in my own mind the variety of topics on which the people around me were doing research at the time The field of nanomaterials has been growing rapidly since the early 1990s Initially the field was populated mostly by researchers working in the fields of synthesis and processing These scientists were able to make new materials much faster than the rest of us could develop ways of looking at them or understanding them However a convergence of interests and capabilities in the 1990s led to the explosive growth of papers in the characterization and modeling parts of the field That convergence came from three primary directions the rapid growth in our ability to make nanomaterials a relatively newfound ability to characterize the nanomaterials at the appropriate length and time scales and the rapid growth in our ability to model nanomaterials at atomistic and molecular scales Simultaneously the commercial potential of nanotechnology has become apparent to most high technology industries as well as to some industries that are traditionally not viewed as high technology such as textiles Much of the rapid growth came through the inventions of physicists and chemists who were able to develop nanotechnology products nanomaterials through a dizzying array of routes and who began to interface directly with biological entities at the nanometer scale That growth continues unabated
