## **Nasa Wings:**

The Aerodynamic Design of Wings with Cambered Span Having Minimum Induced Drag Clarence D. Cone (Jr.),1963 The basic aerodynamic relations needed for the design of wings with cambered span having a minimum induced drag at specified flight conditions are developed for wings of arbitrary spanwise camber Procedures are also developed for determining the physical wing form required to obtain the maximum value of lift drag ratio at cruise when the wing spanwise camber line and section profiles are specified by optimizing the wing chord and twist distributions with respect to both profile and induced drags The application of the design procedure is illustrated by determining the physical wing form for a circular arc spanwise camber line The efficiency of this cambered wing is compared with that of an equal span flat wing of elliptical planform which satisfies the same set of fright operating conditions as does the cambered wing The wing pitching moment equations for optimally loaded cambered span wings at design flight conditions are also developed for use in trim analyses on complete aircraft designs Page 1
