## **Performance Characterization In Computer Vision:**

**Performance Characterization in Computer Vision** Reinhard Klette, H. Siegfried Stiehl, Max A. Viergever, Koen L. Vincken, 2013-04-17 This edited volume addresses a subject which has been discussed intensively in the computer vision community for several years. Performance characterization and evaluation of computer vision algorithms are of key importance particularly with respect to the configuration of reliable and robust computer vision systems as well as the dissemination of reconfigurable systems in novel application domains. Although a plethora of literature on this subject is available for certain areas of computer vision the research community still faces a lack of a well grounded generally accepted and eventually standardized methods. The range of fundamental problems encompasses the value of synthetic images in experimental computer vision the selection of a representative set of real images related to specific domains and tasks the definition of ground truth given different tasks and applications the design of experimental test beds the analysis of algorithms with respect to general characteristics such as complexity resource consumption convergence stability or range of admissible input data the definition and analysis of performance measures for classes of algorithms the role of statistics based performance measures the generation of data sheets with performance measures of algorithms supporting the system engineer in his configuration problem and the validity of model assumptions for specific applications of computer vision.

Performance Characterization of Boosting in Computer Vision Weiliang Li, 2005 The analytical error modeling is based on random sampling but it can be applied to stratified sampling. While training samples are collected under different experimental context designers need an efficient method to evaluate the number of clustered samples versus the within cluster and the overall classification performance. In the last part we propose an effective approach for analyzing the classification errors in stratified sampling design.

Fuzzy Systems and Knowledge Discovery Lipo Wang, Yaochu Jin, 2005-08-17 This book and its sister volume LNAI 3613 and 3614 constitute the proceedings of the Second International Conference on Fuzzy Systems and Knowledge Discovery FSKD 2005 jointly held with the First International Conference on Natural Computation ICNC 2005 LNCS 3610 3611 and 3612 from August 27-29 2005 in Changsha Hunan China. FSKD 2005 successfully attracted 1249 submissions from 32 countries/regions. The joint ICNC FSKD 2005 received 3136 submissions. After rigorous reviews 333 high quality papers i.e. 206 long papers and 127 short papers were included in the FSKD 2005 proceedings representing an acceptance rate of 26.7%. The ICNC FSKD 2005 conference featured the most up to date research results in computational algorithms inspired from nature including biological ecological and physical systems. It is an exciting and emerging interdisciplinary area in which a wide range of techniques and methods are being studied for dealing with large complex and dynamic problems. The joint conferences also promoted cross fertilization over these exciting and yet closely related areas which had a significant impact on the advancement of these important technologies. Specific areas included computation with words fuzzy computation granular computation neural computation quantum computation.

landmarks are robustness w r t lightning conditions and other radiometric variations as well as the ability to cope with large displacements in registration or motion analysis tasks Also landmark based approaches are in general computationally efficient particularly when using point landmarks Note that the term landmark comprises both artificial and natural landmarks Examples are comers or other characteristic points in video images ground control points in aerial images anatomical landmarks in medical images prominent facial points used for biometric verification markers at human joints used for motion capture in virtual reality applications or in and outdoor landmarks used for autonomous navigation of robots This book covers the extraction of landmarks from images as well as the use of these features for elastic image registration Our emphasis is on model based approaches i e on the use of explicitly represented knowledge in image analysis We principally distinguish between geometric models describing the shape of objects typically their contours and intensity models which directly represent the image intensities i e the appearance of objects Based on these classes of models we develop algorithms and methods for analyzing multimodality images such as traditional 2D video images or 3D medical tomographic images

**Scene Reconstruction Pose Estimation and Tracking** Rustam Stolkin, 2007-06-01 This book reports recent advances in the use of pattern recognition techniques for computer and robot vision The sciences of pattern recognition and computational vision have been inextricably intertwined since their early days some four decades ago with the emergence of fast digital computing All computer vision techniques could be regarded as a form of pattern recognition in the broadest sense of the term Conversely if one looks through the contents of a typical international pattern recognition conference proceedings it appears that the large majority perhaps 70 80% of all pattern recognition papers are concerned with the analysis of images In particular these sciences overlap in areas of low level vision such as segmentation edge detection and

other kinds of feature extraction and region identification which are the focus of this book
