Brooks,2012-12-06 1

The Purpose of This Text This text has been written in response to two trends that have gained considerable momentum over the past few years The first is the decision by many undergraduate engineering and science departments to abandon the traditional programming course based on the aging Fortran 77 standard This decision is not surprising considering the more modern features found in languages such as Pascal and C However Pascal never developed a strong following in scientific computing and its use is in decline The new Fortran 90 standard defines a powerful modern language but this long overdue redesign of Fortran has come too late to prevent many colleges and universities from switching to C The acceptance of C by

scientists and engineers is based perhaps as much on their perceptions of C as an important language which it certainly is and on C programming experience as a highly marketable skill as it is on the suitability of C for scientific computation For whatever reason C or its derivative C is now widely taught as the first and often only programming language for undergraduates in science and engineering The second trend is the evolving nature of the undergraduate engineering curriculum At a growing number of institutions the traditional approach of stressing theory and mathematics fundamentals in the early undergraduate years and postponing real engineering applications until later in the curriculum has been turned upside down

Problem Solving with Fortran 90 David R. Brooks, 2012-12-06 i l Overview for Instructors The purpose of this text is to provide an introduction to the problem solving capabilities of Fortran 90 The intended audience is undergraduate science and engineering students who have not previously taken a formal programming course The focus is on the process of solving computational problems of interest to scientists and engineers rather than on programming per se which has several important implications for the contents of the text as outlined later in the Preface Fortran has long been favored as an introductory programming language for engineering and science students because of its historical roots and continued prominence in the professional practice of these disciplines The Fortran 77 standard has been taught within an essentially mainframe context to an entire generation of scientists and engineers However many of the science and engineering calculations that a generation ago could be done only on mainframe computers can now be done on desktop computers often using applications that don t require any programming at all Official Gazette Philippines, 1985
