Rogers,Rae Earnshaw,2001-10-31 In the third paper in this chapter Mike Pratt provides an historical introduction to solid modeling He presents the development of the three most frequently used techniques cellular subdivision constructive solid modeling and boundary representation Although each of these techniques developed more or less independently today the designer's needs dictate that a successful system allows access to all of these methods For example sculptured surfaces are generally represented using a boundary representation However the design of a complex vehicle generally dictates that a sculptured surface representation is most efficient for the skin while constructive solid geometry representation is most efficient for the internal mechanism Pratt also discusses the emerging concept of design by feature line Finally he addresses the very important problem of data exchange between solid modeling systems and the progress that is being made towards developing an international standard With the advent of reasonably low cost scientific workstations with reasonable outstanding graphics capabilities scientists and engineers are increasingly turning to computer analysis for answers to fundamental questions and to computer graphics for presentation of those answers Although the current crop of workstations exhibit quite impressive computational capability they are still not capable of solving many problems in a reasonable time frame e g executing computational fluid dynamics and finite element codes or generating complex ray traced or radiosity based images In the sixth chapter Mike Muuss of the U S *The Grammar of Graphics* Leland Wilkinson,2006-01-28 Preface to First Edition Before writing the graphics for SYSTAT in the 1980 s I began by teaching a seminar in statistical graphics and collecting as many different quantitative graphics as I could find I was determined to produce a package that could draw every statistical graphic I had ever seen The structure of the program was a collection of procedures named after the basic graph types they produced The graphics code was roughly one and a half megabytes in size In the early 1990 s I redesigned the SYSTAT graphics package using object based technology I intended to produce a more comprehensive and generic package I accomplished this by embedding graphical elements in a tree structure Rendering graphics was done by walking the tree and editing worked by adding and deleting nodes The code size fell to under a megabyte In the late 1990 s I collaborated with Dan Rope at the Bureau of Labor Statistics and Dan Carr at George Mason University to produce a graphics production library called GPL this time in Java Our goal was to develop graphics components This book was nourished by that project So far the GPL code size is under half a megabyte **PC Mag** ,1985-12-24 PCMag.com is a leading authority on technology delivering Labs based independent reviews of the latest products and services Our
