patients with balanced information on the advances and limitations of current treatment options DNA Witnessed God's Creation Victor W Chang , Guoping Song,2020-07-04 Who are we Where are we from These questions have troubled people for centuries Textbooks have long taught us that humans evolved from apes Today a new science Molecular Anthropology tells us that nearly 7 billion humans in the world share a common grand grand father the Y chromosome Adam And they also share a common grand grand mother the Mitochondrial Eve The difference in DNA coding is only one thousandth between any persons in the world After reading this book you will be convinced that humans could not have been the result of Evolution In 1987 Professor Allan Wilson s research team at UC Berkeley proposed the Mitochondrial Eve Theory by DNA coding that all humans originated from one woman who lived about 200 000 years ago In 1995 Drs Dorit et proposed the Adam Theory by DNA coding of Y Chromosomal that all humans originated from one man There are two kinds of DNA encoding in our body chromosomal DNA and mitochondrial DNA The chromosome consists of three types autosome Y chromosome and X chromosome The Eve Theory is founded on the mitochondrial DNA while the Adam Theory is founded on the Y chromosome So what can we see from the autosome The simple biological fact that there are no differences between the autosomes of male and female tells us a striking truth that is the autosome of all men in the world must come from only one original version and cannot be produced randomly Therefore the authors of this book have established a The only one Adam theory by the consistency of autosomal DNA coding of men and women All human beings on earth came from him and the earliest female ancestor came from this male ancestor In addition we also provide you with an answer which science cannot offer Creationism *Visualization of Nucleic Acids* Gerard Morel,1995-03-30 This book presents a review of the principle approaches for visualizing DNA and RNA Using scanning tunneling and atomic force microscopes the three dimensional image of the surface of nucleic acids can be seen at atomic scale resolutions Spreading methods provide useful details on structural features of isolated molecules but the major constituent of living matter is water and the cryomicroscope makes it possible to look at DNA in its aqueous environment Genes can be detected simultaneously in situ in chromosomes using fluorescent probes and also at the electron microscopic level In cells nucleic acids are localized and quantified by dyes electron microscopy is used with cytochemical immunocytological nuclease and in situ hybridization methods The main potential applications for pathological studies are shown with particular aspects such as viral nucleic acids and in situ PCR
