Next Generation Sdh Sonet Evolution Or Revolution:

Next Generation SDH/SONET Huub van Helvoort, 2005-10-31 Since the turn of the twentieth century telecommunications has shifted from traditional voice transport to data transport although digitized voice is still a large contributor. Instead of an evolution of existing transport standards a revolution was necessary in order to enable additional data related transport. Next Generation SDH/SONET provides a detailed description of the enablers of efficient data transport over any synchronous network. These include virtual concatenation (VCAT), the operation to provide more granularity and the link capacity adjustment scheme (LCAS), an extension of VCAT that provides more flexibility. Equally, generic framing procedure (GFP), the methodology that efficiently transports asynchronous or variable bit rate data signals over a synchronous or constant bit rate, is explored in detail. Describes new extensions to SDH/SONET standards to provide more granularity and flexibility in their structures, enabling the efficient transport of data related signals such as Ethernet and FICON. Presents comprehensive sections on the implementation of multi-service transport platforms (MSTP) enabled by VCAT, LCAS, and GFP. Provides valuable advice on how to exploit existing networks to create or extend LANs towards metro, MAN, or wide WAN area networks and also to support storage area (SAN) networks. This volume will appeal to manufacturers, engineers, and all those involved in developing and deploying SDH/SONET and OTN technology. It will also be an invaluable resource for postgraduate students on network communications courses.

The ComSoc Guide to Next Generation Optical Transport Huub van Helvoort, 2009-10-27 A comprehensive guide to SDH/SONET and OTN. The ComSoc Guide to Next Generation Optical Transport provides a unique overview of SDH and OTN for engineers who are new to the field as well as manufacturers, network operators, and graduate students who need a basic understanding of the topics. Fully up to date with the latest research and written by one of the foremost experts in the field, it covers Network architectures, Frames and structures, Network modeling, Packet transport, network modeling, Frequency justification, Protection mechanisms, Mapping methodologies, Concatenation, SDH and SONET overhead processing. The book is complemented with 200 illustrations that explain key concepts in an easy-to-understand format while references point readers to the appropriate standards documents for further reading. Whether you're new to the field or just need a basic understanding of SDH, this is a must-have guide.

SDH / SONET Explained in Functional Models Huub van Helvoort, 2005-11-01 H/SONET Explained in Functional Models represents a fresh approach to the modeling of transport network technologies. This practical guide and reference text uncovers the description of SDH (Synchronous Digital Hierarchy), SONET (Synchronous Optical Network), and OTN (Optical Transport Network) transport networks and equipment using functional atomic modeling techniques. It clearly explains the use of models in the ITU-T and ETSI standards, the transport networks, and the transport equipment in the definition, implementation, and deployment phase. Pays particular attention to the SDH and OTN standards using functional atomic modeling as used and defined in the ITU-T International Telecommunication Union recommendations G.805 and G.809 and

the ETSI European Telecommunications Standards Institute standards EN 300 417 as opposed to the formal language used in the ANSI American National Standards Institute standard T1 105 Topics of discussion range from functional modeling high level transport networks to the most detailed device functions aided by a variety of figures and tables Shows that functional modeling is not restricted to SDH SONET but that it can be used to describe any transport network connection oriented and connectionless e.g. Ethernet and MPLS networks Written by a leading authority in the area this is the first book dedicated to the novel approach of using functional modeling to describe SDH SONET OTN networks This volume will appeal to manufacturers engineers and all those involved in developing and deploying SDH SONET OTN Ethernet MPLS technology It will be an invaluable resource for postgraduate students on network communications courses and advanced users using functional modeling

The Cable and Telecommunications Professionals' Reference Goff Hill, 2012-07-26 Volume 2 of TERB 3ed covers the convergence of telephony and data transport including wireless networks Now that data is becoming the predominant source of traffic more efficient multiplexing schemes and more flexible control methods are needed in the transport network such as giving the customer the ability to call for bandwidth on demand With the development of control methods for switched data services it is now recognised that improved ways to control the transport network are possible and standards initiatives are taking place to establish and improve the network control layer Detailed explanation of propagation in wireless and optical fibre systems requires a substantial amount of mathematics also covered in this volume For each of the math chapters there is an explanation of why the mathematics is important where it is applied and references to other chapters
