High-performance Packet Switching Architectures Itamar Elhanany,Mounir Hamdi,2006-09-06 Internet traffic is

increasing by at least 200% per year and the world's largest Internet Service Provider expects traffic on its regional trunks to grow to a 1-10 petabit range over the next four to five years. Wavelength division multiplexing (WDM) long haul fiber optic links and high capacity all optical circuit switches are now being used in the Internet core to handle this traffic creating demand for the high performance packet switches, IP routers, ATM switches and Ethernet Switches which feed this optical core. In the last ten years tremendous technological advances have taken place to meet these objectives. This is the first book to cover these advances in a comprehensive survey. It provides integrated coverage of the state of the art in packet switching technology by presenting contributions from the leading researchers in industry and universities. A mix of theoretical and practical material makes this book an essential reference for researchers in academia as well as industrial engineers.

Power Aware Computing Robert Graybill, Rami Melhem, 2013-04-17. With the advent of portable and autonomous computing systems, power consumption has emerged as a focal point in many research projects, commercial systems and DoD platforms. One current research initiative which drew much attention to this area is the Power Aware Computing and Communications (PAC-C) program sponsored by DARPA. Many of the chapters in this book include results from work that have been supported by the PAC-C program. The performance of computer systems has been tremendously improving while the size and weight of such systems has been constantly shrinking. The capacities of batteries relative to their sizes and weights has been also improving but at a rate which is much slower than the rate of improvement in computer performance and the rate of shrinking in computer sizes. The relation between the power consumption of a computer system and its performance and size is a complex one which is very much dependent on the specific system and the technology used to build that system. We do not need a complex argument however to be convinced that energy and power which is the rate of energy consumption are becoming critical components in computer systems in general and portable and autonomous systems in particular. Most of the early research on power consumption in computer systems addressed the issue of minimizing power in a given platform which usually translates into minimizing energy consumption and thus longer battery life.
