Catalog*, 1904 Tropical Nature and Other Essays Alfred Russel Wallace, It is difficult for an inhabitant of our temperate land to realize either the sudden and violent contrasts of the arctic seasons or the wonderful uniformity of the equatorial climate The lengthening or the shortening days the ever changing tints of spring

summer and autumn succeeded by the leafless boughs of winter are constantly recurring phenomena which represent to us the established course of nature At the equator none of these changes occur there is a perpetual equinox and a perpetual summer and were it not for variations in the quantity of rain in the direction and strength of the winds and in the amount of sunshine accompanied by corresponding slight changes in the development of vegetable and animal life the monotony of nature would be extreme In the present chapter it is proposed to describe the chief peculiarities which distinguish the equatorial from the temperate climate and to explain the causes of the difference between them causes which are by no means of so simple a nature as are usually imagined The three great divisions of the earth the tropical the temperate and the frigid zones may be briefly defined as the regions of uniform of variable and of extreme physical conditions respectively They are primarily determined by the circumstance of the earth's axis not being perpendicular to the plane in which it moves round the sun whence it follows that during one half of its revolution the north pole and during the other half the south pole is turned at a considerable angle towards the source of light and heat This inclination of the axis on which the earth rotates is usually defined by the inclination of the equator to the plane of the orbit termed the obliquity of the ecliptic The amount of this obliquity is 23 degrees and this measures the extent on each side of the equator of what are called the tropics because within these limits the sun becomes vertical at noon twice a year and at the extreme limit once a year while beyond this distance it is never vertical It will be evident however from the nature of the case that the two lines which mark the limits of the geographical tropics will not define any abrupt change of climate or physical conditions such as characterise the tropical and temperate zones in their full development There will be a gradual transition from one to the other and in order to study them separately and contrast their special features we must only take into account the portion of each in which these are most fully exhibited For the temperate zone we may take all countries situated between 35 and 60 of latitude which in Europe will include every place between Christiania and Algiers the districts further south forming a transitional belt in which temperate and tropical features are combined In order to study the special features of tropical nature on the other hand it will be advisable to confine our attention mainly to that portion of the globe which extends for about twelve degrees on each side of the equator in which all the chief tropical phenomena dependent on astronomical causes are most fully manifested and which we may distinguish as the equatorial zone In the debateable ground between these two well contrasted belts local causes have a preponderating influence and it would not be difficult to point out localities within the temperate zone of our maps which exhibit all the chief characteristics of tropical nature to a greater degree than other localities which are as regards geographical position tropical
