Marine Genetic Resources, Access and Benefit Sharing Bevis Fedder, 2013-05-29 Access to genetic resources and Benefit Sharing ABS has been promoted under the Convention on Biological Diversity with the aim of combining biodiversity conservation goals with economic development However as this book shows since its inception in 1992 implementation has encountered multiple challenges and obstacles This is particularly so in the marine environment where interest in genetic resources for pharmaceuticals and nutrients has increased This is partly because of the lack of clarity of terminology but also because of the terms of the comprehensive law of the sea UNCLOS and transboundary issues of delineating ownership of marine resources The author explains and compares relevant provisions and concepts under ABS and the law of the sea taking access benefit sharing monitoring compliance and dispute settlement into consideration He also provides an overview of the implementation status of ABS relevant measures in user states and identifies successful ABS transactions A key unique feature of the book is to illustrate how biological databases can serve as the central scientific infrastructure to implement the global multilateral benefit sharing mechanism proposed by the Nagoya Protocol The research for this book was supported by both the Bremen International Graduate School for Marine Sciences GLOMAR and the International Research Training Group INTERCOAST Integrated Coastal Zone and Shelf Sea Research

Marine Biodiversity of Costa Rica, Central America Ingo S.

Wehrtmann, Jorge Cortés, 2008-12-28 Life began in the sea and even today most of the deep diversity of the planet is marine. This is often forgotten especially in tropical countries like Costa Rica renowned for their rain forests and the multitude of life forms found therein. Thus this book focusing on marine diversity of Costa Rica is particularly welcome. How many marine species are there in Costa Rica? The authors report a total of 6 777 species or 3.5% of the world's total. Yet the vast majority of marine species have yet to be formally described. Recent estimates of the numbers of species on coral reefs range from 1.9 million so that the true number of marine species in Costa Rica is certainly far higher. In some groups the numbers are likely to be vastly higher because to date they have been so little studied. Only one species of nematode is reported despite the fact that it has been said that nematodes are the most diverse of all marine groups. In better studied groups such as mollusks and crustaceans reported numbers are in the thousands but even in these groups many species remain to be described. Indeed the task of describing marine species is daunting if there really are about 9 million marine species and Costa Rica has 3.5% of them then the total number would be over 300 000. Clearly so much remains to be done that new approaches are needed. Genetic methods have enormous promise in this regard.

Martin Waldseemüller's 'Carta marina' of 1516 Chet Van Duzer, 2019-10-09 This open access book presents the first detailed study of one of the most important masterpieces of Renaissance cartography Martin Waldseemüller's Carta marina of 1516. By transcribing translating into English and detailing the sources of all of the descriptive texts on the map as well as the sources of many of the images the book makes the map available to scholars in a wholly unprecedented way. In addition the book provides revealing insights into how Waldseemüller went about making the map information that can't be found in any other source. The Carta marina is the result of Waldseemüller's radical re-evaluation of what a world map should be. He essentially started from scratch when he

created it rejecting the Ptolemaic model and other sources he had used in creating his 1507 map and added more descriptive texts and a wealth of illustrations Given its content the book offers an essential reference work not only on this map but also for anyone working in sixteenth century European cartography
