A Framework to Guide Selection of Chemical Alternatives National Research Council, Division on Earth and Life Studies, Board on Environmental Studies and Toxicology, Board on Chemical Sciences and Technology, Committee on the Design and Evaluation of Safer Chemical Substitutions: A Framework to Inform Government and Industry Decisions, 2014-10-29 Historically regulations governing chemical use have often focused on widely used chemicals and acute human health effects of exposure to them as well as their potential to cause cancer and other adverse health effects As scientific knowledge has expanded there has been an increased awareness of the mechanisms through which chemicals may exert harmful effects on human health as well as their effects on other species and ecosystems Identification of high priority chemicals and other chemicals of concern has prompted a growing number of state and local governments as well as major companies to take steps beyond existing hazardous chemical federal legislation Interest in approaches and policies that ensure that any new substances substituted for chemicals of concern are assessed as carefully and thoroughly as possible has also burgeoned The overarching goal of these approaches is to avoid regrettable substitutions which occur when a toxic chemical is replaced by another chemical that later proved unsuitable because of persistence bioaccumulation toxicity or other concerns Chemical alternative assessments are tools designed to facilitate consideration of these factors to assist stakeholders in identifying chemicals that may have the greatest likelihood of harm to human and ecological health and to provide guidance on how the industry may develop and adopt safer alternatives A Framework to Guide Selection of Chemical Alternatives develops and demonstrates a decision framework for evaluating potentially safer substitute chemicals as primarily determined by human health and ecological risks This new framework is informed by previous efforts by regulatory agencies academic institutions and others to develop alternative assessment frameworks that could be operationalized In addition to hazard assessments the framework incorporates steps for life cycle thinking which considers possible impacts of a chemical at all stages including production use and disposal as well as steps for performance and economic assessments The report also highlights how modern information sources such as computational modeling can supplement traditional toxicology data in the assessment process This new framework allows the evaluation of the full range of benefits and shortcomings of substitutes and examination of tradeoffs between these risks and factors such as product functionality product efficacy process safety and

resource use Through case studies this report demonstrates how different users in contrasting decision contexts with diverse priorities can apply the framework This report will be an essential resource to the chemical industry environmentalists ecologists and state and local governments

Cellular and Molecular Toxicology J.P. Vanden Heuvel,W.F. Greenlee,G.H. Perdew,William B. Mattes,2002-02-14 Volume 14 in the series Comprehensive Toxicology extends and complements the previously published 13 volume set This volume will be available separately Toxicology is the study of the nature and actions of chemicals on biological systems In more primitive times it really was the study of poisons However in the early 1500s it was apparent to Paracelsus that the dose differentiates a poison and a remedy Clearly the two most important tenets of toxicology were established during that time The level of exposure dose and the duration of exposure time will determine the degree and nature of a toxicological response Since that time the discipline of toxicology has made major advances in identifying and characterizing toxicants The growth of toxicology as a scientific discipline has been driven to a large extent by the use of extremely powerful molecular and cell biology techniques The overall aim of this volume is to demonstrate how these advances are being used to elucidate causal pathways or linkages for potential adverse health consequences of human exposure to environmental chemicals or radiation A unique feature of this volume is its illustration of how carefully designed studies of the molecular mechanisms of chemical action provide not only understanding of the potential toxicity of the chemical under investigation but also new insights into the functioning of the biological system used as an experimental model Each chapter contains a listing of major peer reviewed articles and reviews and useful web sites In addition each chapter contains a broad introductory section that outlines the subsequent sections These Introductory and Overview sections are designed to be stand alone chapters and may be packaged as a textbook in graduate level courses

The History of Alternative Test Methods in Toxicology ,2018-10-20 The History of Alternative Test Methods in Toxicology uses a chronological approach to demonstrate how the use of alternative methods has evolved from their conception as adjuncts to traditional animal toxicity tests to replacements for them This volume in the History of Toxicology and Environmental Health series explores the history of alternative test development validation and use with an emphasis on humanity and good science in line with the Three Rs Replacement Reduction Refinement concept expounded by William Russell and Rex Burch in 1959 in their now classic volume *The Principles of Humane Experimental Technique* The book describes the historical development of technologies that have influenced the application of alternatives in toxicology and safety testing These range from single cell monocultures to sophisticated miniaturised and microfluidic organism on a chip devices and also include molecular modelling chemoinformatics and QSAR analysis and the use of stem cells tissue engineering and hollow fibre bioreactors This has been

facilitated by the wider availability of human tissues advances in tissue culture analytical and diagnostic methods increases in computational processing capabilities and a greater understanding of cell biology and molecular mechanisms of toxicity These technological developments have enhanced the range and information content of the toxicity endpoints detected and therefore the relevance of test systems and data interpretation while new techniques for non invasive diagnostic imaging and high resolution detection methods have permitted an increased role for human studies Several key examples of how these technologies are being harnessed to meet 21st century safety assessment challenges are provided including their deployment in integrated testing schemes in conjunction with kinetic modelling and in specialised areas such as inhalation toxicity studies
