Fourwing Saltbush (Atriplex Canescens) Seed Transfer Zones Stewart Cottam Sanderson, 2004 Atriplex canescens Pursh Nutt is the most widespread species of perennial Atriplex in North America Throughout its distributional range A canescens shows considerable between population variation Some of this variation may be due to phenotypic plasticity but most of it appears to be genetic Mutations polyploidy introgressive hybridization and segregation from interspecific hybrids all appear to have contributed to its extensive heritable variation Polyploidy is unusually common with numerous chromosome races 2x 4x 6x 8x 10x 12x 14x 20x Fourwing saltbush is widely used for reclamation plantings Proper identification is important to the utilization of fourwing saltbush in such plantings While many of the races have been formally named as varieties others have not Even though differentiated by ploidy chemical constituents geographic distribution and statistical distribution of morphological characters races may lack sufficient diagnostic characters to allow facile identification at least in the herbarium Rather than combining unnamed races under those that do have a taxonomic name it seems better at present not to use the formal infraspecific categories in treating the fourwing saltbushes but to consider them all as races Seed transfer should be within the geographical distribution limits of each race The most common race by far is Occidentalis We recommend four overlapping seed transfer zones for race Occidentalis in the United States 1 Northern Intermountain 2 Western Great Plains 3 Colorado Plateau Great Basin Columbia Basin and 4 Southwestern Source seed populations from near the planting sites generally do well and populations generally perform better when moved south and or to lower elevations than when moved north and or up in elevation Seed and Soil Dynamics in Shrubland Ecosystems Ann L.
