Dense Phase Carbon Dioxide

Murat O. Balaban,Giovanna Ferrentino,2012-04-05 Dense phase carbon dioxide DPCD is a non thermal method for food and pharmaceutical processing that can ensure safe products with minimal nutrient loss and better preserved quality attributes Its application is quite different than for example supercritical extraction with CO₂ where the typical solubility of materials in CO₂ is in the order of 1% and therefore requires large volumes of CO₂ In contrast processing with DPCD requires much less CO₂ between 5 to 8% CO₂ by weight and the pressures used are at least one order of magnitude less than those typically used in ultra high pressure UHP processing There is no noticeable temperature increase due to pressurization and typical process temperatures are around 40 °C DPCD temporarily reduces the pH of liquid foods and because oxygen is removed from the environment and because the temperature is not high during the short process time typically about five minutes in continuous systems nutrients antioxidant activity and vitamins are much better preserved than with thermal treatments In pharmaceutical applications

DPCD facilitates the production of micronized powders of controlled particle size and distribution Although the capital and operating costs are higher than that of thermal treatments they are much lower than other non thermal technology operations This book is the first to bring together the significant amount of research into DPCD and highlight its effectiveness against microorganisms and enzymes as well as its potential in particle engineering It is directed at food and pharmaceutical industry scientists and technologists working with DPCD and other traditional or non thermal technologies that can potentially be used in conjunction with DPCD It will also be of interest to packaging specialists and regulatory agencies **NASA Technical Memorandum** ,1976 *Neutrosophic Sets and Systems, Vol. 44, 2021.
