Natural Sinks of CO₂ Joe Wisniewski, Ariel E. Lugo, 2012-12-06 Most of the attention with respect to the increase in atmospheric greenhouse gas concentrations centers around three issues human generated sources of carbon mostly from burning fossil fuels tropical deforestation which accelerates the production of atmospheric carbon while causing havoc with biodiversity and the economic development of tropical countries and the temperature increase that may accompany increased atmospheric greenhouse gas concentrations This is the first book to focus extensively on the reverse to emissions of carbon dioxide CO₂ i.e. the sequestering of atmospheric carbon by aquatic and terrestrial ecosystems Natural ecosystems are currently sequestering carbon and it is economically feasible to manage existing and additional terrestrial forest soil saline land and aquatic coastal wetland and ocean ecosystems to substantially increase the level of carbon storage The prospect of managing natural systems to absorb additional carbon should begin to change the mindset under which scientists policy makers and society deal with the issue of further greenhouse gas increases Air Quality Criteria for Carbon Monoxide, 1991 **Comprehensive Chemistry XI** Dr. B. Smith, 2012-12-06 This series is dedicated to serving the growing community of scholars and practitioners concerned with the principles and applications of environmental management Each volume will be a thorough treatment of a specific topic of importance for proper management practices A fundamental objective of these books is to help the reader discern and implement man's stewardship of our environment and the world's renewable resources For we must strive to understand the relationship between man and nature act to bring harmony to it and nurture an environment that is both stable and productive These objectives have often eluded us because the pursuit of other individual and societal goals has diverted us from a course of living in balance with the environment At times therefore the environmental manager may have to exert restrictive control which is usually best applied to man not nature Attempts to

alter or harness nature have often failed or backfired as exemplified by the results of imprudent use of herbicides fertilizers water and other agents Each book in this series will shed light on the fundamental and applied aspects of environmental management It is hoped that each will help solve a practical and serious environmental problem

Geological Disposal of Carbon Dioxide and Radioactive Waste: A Comparative Assessment Ferenc L. Toth,2011-02-21 Fossil fuels will remain the backbone of the global energy economy for the foreseeable future The contribution of nuclear energy to the global energy supply is also expected to increase With the pressing need to mitigate climate change and reduce greenhouse gas emissions the fossil energy industry is exploring the possibility of carbon dioxide disposal in geological media Geological disposal has been studied for decades by the nuclear industry with a view to ensuring the safe containment of its wastes Geological disposal of carbon dioxide and that of radioactive waste gives rise to many common concerns in domains ranging from geology to public acceptance In this respect comparative assessments reveal many similarities ranging from the transformation of the geological environment and safety and monitoring concerns to regulatory liability and public acceptance issues However there are profound differences on a broad range of issues as well such as the quantities and hazardous features of the materials to be disposed of the characteristics of the targeted geological media the site engineering technologies involved and the timescales required for safe containment at the disposal location There are ample opportunities to learn from comparisons and to derive insights that will assist policymakers responsible for national energy strategies and international climate policies

After Geoengineering Holly Jean Buck,2019-10-01 What if the people seized the means of climate production The window for action on climate change is closing rapidly We are hurtling ever faster towards climate catastrophe the destruction of a habitable world for many species perhaps the near extinction of our own As anxieties about global temperatures soar demands for urgent action grow louder What can be done Can this process be reversed Once temperatures rise is there any going back Some are thinking about releasing aerosols into the stratosphere in order to reflect sunlight back into space and cool the earth And this may be necessary if it actually works But it would only be the beginning it s what comes after that counts In this groundbreaking book Holly Jean Buck charts a possible course to a liveable future Climate restoration will require not just innovative technologies to remove carbon from the atmosphere but social and economic transformation The steps we must take are enormous and they must be taken soon Looking at industrial scale seaweed farms the grinding of rocks to sequester carbon at the bottom of the sea the restoration of wetlands and reforestation Buck examines possible methods for such transformations and meets the people developing them Both critical and utopian speculative and realistic After
