Diamond is the record setter in many mineralogical properties such as hardness diffusivity thermal conductivity purity and covalency of bonding Similarly diamond as the premier gemstone of the mantle holds primacy for geological features such as age and depth of origin Diamond was among the first crystalline structures to be solved by X ray diffraction and the first materials measured for their Raman spectrum At more than 80 billion USD in yearly commercial value diamond sets the record for the most traded valuable mineral on the planet Despite its chemical simplicity diamond has been the object of more research effort and had more scientific and popular press pages written about it than any other mineral **Genesis of**

Diamonds and Associated Phases Yuriy A. Litvin, 2017-05-17 This book presents an overview of recent advances in our understanding of the genesis of diamonds and the associated phases It is divided into three main parts starting with an introduction to the analysis of diamond inclusions to infer the formation processes In turn the second part of the book presents high pressure experimental studies in mantle diamond parental mineral systems with representative multicomponent boundary compositions The experimental syngensis phase diagrams provided reveal the physicochemical mechanisms of diamond nucleation and substantiate the mantle carbonatite concept of the genesis of diamonds and associated phases Lastly the book describes the genetic classification of diamond hosted mineral inclusions and experimentally determined RE mineral parental melt partition coefficients The physicochemical experimental evidence presented shows the driving forces behind the fractional evolution of the mantle magmas and diamond parental melts Given the depth and breadth of its coverage the book offers researchers essential new insights into the ways diamonds and associated minerals and rocks are naturally created **Precious Stones in Nature, Art, and Literature** Sarah Maria

Field, 1992-10-21 This text examines advances made in understanding the physical properties of diamond and in finding new technological applications Coverage includes developments in the growth of thin diamond films which should have major implications for a range of industrial applications

Optical Properties of Diamond A.M. Zaitsev, 2013-03-09 The unique properties of diamond are responsible for its pre eminence as a gemstone and give it a glamour and attraction unprecedented for any other mineral As the first member of group IV of the periodic table of elements carbon in its crystalline form as diamond has also fascinated scientists for at least 300 years Many experimental techniques have been

employed in the study of diamond and of these optical spectroscopy has proven one of the most fruitful The absorption line at 415 nm characteristic of Cape Yellow diamonds was first documented by Walter in 1891 Further work on this absorption now known as N3 by the Indian school under Sir C V Raman in the 1930s and 1940s led to a basic understanding of the system which they observed in both absorption and luminescence The N3 center is a structural defect in the diamond and the absorption of light occurs by exciting electrons in this defect from one well defined energy state to another When the electron returns to the original energy level luminescence is produced Detailed studies of natural diamonds over the subsequent 60 years have discovered large numbers of absorption and emission lines characteristic of different defects In 1904 Sir William Crookes showed that a colorless diamond could be turned green by long exposure to radium salts

Fluorescent Nanodiamonds Huan-Cheng Chang, Wesley Wei-Wen Hsiao, Meng-Chih Su, 2018-09-12 The most comprehensive reference on fluorescent nanodiamond physical and chemical properties and contemporary applications Fluorescent nanodiamonds FNDs have drawn a great deal of attention over the past several years and their applications and development potential are proving to be manifold and vast The first and only book of its kind *Fluorescent Nanodiamonds* is a comprehensive guide to the basic science and technical information needed to fully understand the fundamentals of FNDs and their potential applications across an array of domains In demonstrating the importance of FNDs in biological applications the authors bring together all relevant chemistry physics materials science and biology Nanodiamonds are produced by powerful cataclysmic events such as explosions volcanic eruptions and meteorite impacts They also can be created in the lab by high pressure high temperature treatment of graphite or detonating an explosive in a reactor vessel A single imperfection can give a nanodiamond a specific isolated color center which allows it to function as a single trapped atom Much smaller than the thickness of a human hair a nanodiamond can have a huge surface area that allows it to bond with a variety of other materials Because of their non toxicity nanodiamonds may be useful in biomedical applications such as drug delivery and gene therapy The most comprehensive reference on a topic of rapidly increasing interest among academic and industrial researchers across an array of fields Includes numerous case studies and practical examples from many areas of research and industrial applications as well as fascinating and instructive historical perspectives Each chapter addresses in depth a single integral topic including the fundamental properties synthesis mechanisms and functionalisation of FNDs The first book published by the key patent holder with his research group in the field of FNDs *Fluorescent Nanodiamonds* is an important working resource for a broad range of scientists and engineers in industry and academia It will also be a welcome reference for instructors in chemistry physics materials science biology and related fields
