Mobile Multimedia Broadcasting Standards Fa-Long Luo, 2008-11-06. Mobile multimedia broadcasting compasses a broad range of topics including radio propagation, modulation and demodulation, error control, signal compression and coding, transport and time slicing system on chip, real time implementation in hardware, software and system levels. The major goal of this technology is to bring multimedia enriched contents to handheld devices such as mobile phones, portable digital assistants and media players through radio transmission or internet protocol IP based broadband networks. Research and development of mobile multimedia broadcasting technologies are now explosively growing and regarded as new killer applications. A number of mobile multimedia broadcasting standards related to transmission, compression and multiplexing now coexist and are being extensively further developed. The development and implementation of mobile multimedia broadcasting systems are very challenging tasks and require the huge efforts of the related industry, research and regulatory authorities so as to bring the success. From an implementation design and engineering practice point of view, this book aims to be the first single volume to provide a comprehensive and highly coherent treatment for multiple standards of mobile multimedia broadcasting by covering basic principles, algorithms, design trade off and well compared implementation system examples. This book is organized into 4 parts with 22 chapters.

OFDM and MC-CDMA for Broadband Multi-User Communications, WLANs and Broadcasting Lajos Hanzo, M. Münster, Byungcho Choi, Thomas Keller, 2005-01-28. Orthogonal frequency division multiplexing (OFDM) is a method of digital modulation in which a signal is split into several narrowband channels at different frequencies. CDMA is a form of multiplexing which allows numerous signals to occupy a single transmission channel, optimising the use of available bandwidth. Multiplexing is sending multiple signals or streams of information on a carrier at the same time in the form of a single complex signal and then recovering the separate signals at the receiving end. Multi-Carrier MC-CDMA is a combined technique of Direct Sequence DS-SS, CDMA Code Division Multiple Access and OFDM techniques. It applies spreading sequences in the frequency domain. Wireless communications has witnessed a tremendous growth during the past decade and further spectacular enabling technology advances are expected in an effort to render ubiquitous wireless connectivity a reality. This technical in depth book is unique in its detailed exposure of OFDM, MIMO, OFDM and MC-CDMA. A further attraction of the joint treatment of these topics is that it allows the reader to view their design trade offs in a comparative context. Divided into three main parts, Part I provides a detailed exposure of OFDM designed for employment in various applications. Part II is another design alternative applicable in the context of OFDM systems where the channel quality fluctuations observed are averaged out with the aid of frequency domain spreading codes which leads to the concept of MC-CDMA. Part III discusses how to employ multiple antennas at the base station for the sake

of supporting multiple users in the uplink Portrays the entire body of knowledge currently available on OFDM Provides the first complete treatment of OFDM MIMO Multiple Input Multiple Output OFDM and MC CDMA Considers the benefits of channel coding and space time coding in the context of various application examples and features numerous complete system design examples Converts the lessons of Shannon's information theory into design principles applicable to practical wireless systems Combines the benefits of a textbook with a research monograph where the depth of discussions progressively increase throughout the book This all encompassing self contained treatment will appeal to researchers postgraduate students and academics practising research and development engineers working for wireless communications and computer networking companies and senior undergraduate students and technical managers

Intelligent Multimedia Communication: Techniques and Applications Chang Wen Chen, Zhu Li, Shiguo Lian, 2011-07-06

Multimedia data are used more and more widely in human being's life e.g. videoconferencing, visual telephone, IPTV etc. Nearly most of the applications need multimedia transmission techniques that send multimedia data from one side to another side and keep the properties of efficiency, robustness and security. Here the efficiency denotes the time cost of transmission operations, the robustness denotes the ability to survive transmission errors or noises and the security denotes the protection of the transmitted media content. Recently various intelligent or innovative techniques are invented which bring vast performance improvements to practical applications. For example, such content transmission techniques as p2p sensor network and ad hoc network are constructed which adaptively use the peers' properties to improve the network's resources. Multimedia adaptation techniques can adjust the multimedia data rate in order to comply with the network's bandwidth. Scalable encryption techniques can generate the data stream that can be correctly decrypted after bit rate conversion. Ubiquitous multimedia services make the user share any kind of content anywhere. The book includes fourteen chapters highlighting current concepts, issues and emerging technologies. Distinguished scholars from many prominent research institutions around the world contribute to the book. The book covers various aspects including not only some fundamental knowledge and the latest key techniques but also typical applications and open issues. For example, the covered topics include the present and future video coding standards, stereo and multiview coding techniques, free viewpoint TV techniques, wireless broadcasting techniques, media streaming techniques, wireless media transmission techniques and systems and User Generated Content sharing.
