1. ABSTRACT

The problem of structural fire safety in the recent years has gained a predominant position within the engineering design, with the affirmation of Performance Based structural Codes and Standards, replacing more and more the traditional Prescriptive Based ones. This is because nowadays, structures always bigger and more complex are designed and build, with the use of particularly fire sensitive materials. In modeling such complex structures, there are important aspects that need to be taken into account, especially when setting the boundary conditions of the structural problem as defined by the design environment. In this paper, aspects of the fire risk analysis procedure applied in an industrial facility are presented, along with the numerical modeling of the consequent structural behavior. The aim is to evaluate by means of nonlinear non stationary analyses what happens to the structural elements, and as a consequence to the structure, when the fire is not restrained.

2. INTRODUCTION

The use of analysis with thermo-plastic material and with geometric nonlinearity and the modeling of fire action by using of parametric curves allow the correct evaluation of the real behavior of steel structures subject to fire. In this context, once these two basic aspects have been understood, they are developed in steel structures subject to fire action. For these structures the collapse can be quantified

System Safety Engineering and Risk Assessment Nicholas J. Bahr, 2018-10-08 We all know that safety should be an integral part of the systems that we build and operate. The public demands that they are protected from accidents yet industry and government do not always know how to reach this common goal. This book gives engineers and managers working in companies and governments around the world a pragmatic and reasonable approach to system safety and risk assessment techniques. It explains in easy to understand language how to design workable safety management systems and implement tested solutions immediately. The book is intended for working engineers who know that they need to build safe systems but aren't sure where to start. To make it easy to get started quickly it includes numerous real life engineering examples. The book's many practical tips and best practices explain not only how to prevent accidents but also how to build safety into systems at a sensible price. The book also includes numerous case studies from real disasters that describe what went wrong and the lessons learned. See What's New in the Second Edition: New chapter on developing government safety oversight programs and regulations including designing and setting up a new safety regulatory body; developing safety regulatory oversight functions and governance; developing safety regulations and how to avoid common mistakes in government oversight. Significantly expanded chapter on safety management systems with many practical applications from around the world and information about designing and building robust safety management systems; auditing them; gaining internal support and creating a safety culture. New and expanded case studies and Notes from Nick's Files: examples of practical applications from the author's extensive experience. Increased international focus on world leading practices from multiple industries with practical examples. Common mistakes to avoid and new thinking about how to build sustainable safety management systems. New material on safety culture; developing leading safety performance indicators; safety maturity model; auditing safety management systems and setting up a safety knowledge management system. *Proceedings of the International Symposium on Engineering under Uncertainty: Safety Assessment and Management (ISEUSAM - 2012)* Subrata Chakraborty, Gautam Bhattacharya, 2013-03-12 International Symposium on Engineering under Uncertainty: Safety Assessment and Management ISEUSAM 2012 is organized by Bengal Engineering and Science University India during the first week of January 2012 at Kolkata.
