**Effectiveness of Wyoming's Sage-grouse Core Areas in Conserving Greater Sage-grouse and Mule Deer and Influence of Energy Development on Big Game Harvest** R. Scott Gamo,2016 Increasing demand for energy has led to expanded extraction of energy reserves which in turn impact habitats and populations of iconic western species including greater sage grouse *Centrocercus urophasianus* mule deer *Odocoileus hemionus* and pronghorn *Antilocapra americana* across the West Policy makers and managers have implemented protections and regulations within designated landscapes to manage focal wildlife species under these conditions My study evaluates the conservation effectiveness of these landscapes on these focal species in Wyoming within Core Areas established under the Wyoming Governor s Sage grouse Executive

Order SGEO implemented in 2008 by then Wyoming Governor Dave Freudenthal Greater sage grouse populations have declined across their range due to human assisted factors driving large scale habitat change In response the state of Wyoming implemented the SGEO protection policy in 2008 as a voluntary regulatory mechanism to minimize anthropogenic disturbance within defined sage grouse core population areas This dissertation consists of two empirical based chapters that focus on evaluating the effectiveness of sage grouse core areas in providing conservation of sage grouse and mule deer which share habitat with sage grouse across Wyoming An additional focus of this dissertation was to investigate the impact of oil and gas development on harvest success for mule deer and pronghorn

**LANDSCAPE MANAGEMENT FOR A LANDSCAPE SPECIES** Emma Suzuki Spence, 2017 Greater Sage grouse *Centrocercus urophasianus* are both an umbrella and flagship species for conservation concern throughout the intermountain west For the past fifty years sage grouse populations have been experiencing a range wide decline Long term declines in sage grouse abundance have prompted eight listing attempts for the species under provisions of the Endangered Species Act ESA Proximate causes of population decline differ across sage grouse distribution but ultimately the underlying cause is loss or degradation of suitable sagebrush land cover Wyoming is arguably the most important region for sage grouse management because Wyoming is not only at the center of sage grouse distribution but also hosts the largest sage grouse population of any state in the species 11 US State 3 Canadian Province range In 2008 then Governor Dave Freudenthal signed an executive order that enacted the Greater Sage grouse Core Area Protection that set aside 31 distinct regions called Core Areas which collectively encompass 24% of the total area of Wyoming State of Wyoming 2008 Upon establishment these Core Areas contained 82% of the male sage grouse in Wyoming at that time State of Wyoming 2008 State of Wyoming 2010 However since establishment the Core Areas established by the SGEO have been redrawn or modified 4 times For my research I investigated the overall effectiveness of the Core Areas as established by the SGEO in Wyoming in light of anthropogenic impacts Using the Wyoming Game and Fish Department's WGFD sage grouse lek database to characterize sage grouse populations across Wyoming along with other publically available data sets we found that the Core Areas

contained 64% of all active leks and accounted for 77% of male sage grouse attending leks Furthermore we found that Core Areas had a higher average lek attendance average males core lek 22 7 76 average males non core lek 9 2 25 t test df 1 821
