Regulation Of Hematopoiesis:

Regulation of Hematopoiesis: Red cell production Albert Saul Gordon, 1970 *Negative Regulation of Hematopoiesis* A. Najman, Martine Guigon, F. M. Lemoine, N. Dainiak, A. Schechter, 2008-08 This book gives an update on the inhibitory mechanisms involved in the various steps of hematopoietic stem cell proliferation and differentiation The authors report the latest research advances factors that control the cell cycle receptors function molecular approaches the in vivo and in vitro effects of several inhibitors the inhibition of hematopoiesis by viruses protecting the bone marrow The book contains the latest results published by the best international specialists and will be fascinating reading for all those interested in this subject *Biomedical Index to PHS-supported Research* , 1990 *Theory of Hematopoiesis Control* A.M. Dygai, V.V. Zhdanov, 2014-09-16 This monograph summarizes the large amount of experimental data accumulated during many years of studying the functions of the blood system and its regulatory mechanisms under the action of diverse morbid factors within the models of pathological processes e g immobilization stress blood loss inflammation cytostatic and radiation myelosuppressions experimental encephalopathies neuroses and spontaneous leucosis These data are analyzed with the understanding that hematopoietic tissue is an integrated system that can react to the challenges of both the internal and external environments This analysis helped develop the theory of hematopoiesis control describing the regularities in the work of basic subdivisions of the hematopoietic tissue under normal and pathological conditions as well as the performance and interaction of the local and long ranged control systems The monograph is recommended for Physiologists Pathophysiologists Hematologists Oncologists Pharmacologists and other professionals *Research Awards Index* , 1984

The Role of Hematopoietic Progenitors in Immune Regulation and Memory Flora Zavala, César Nombela Arrieta, Paolo Fiorina, Moufida Ben Nasr, 2022-01-07 *Immunology* Richard A. Goldsby, 2003 The new edition of the acclaimed bestseller always praised for offering cutting edge material in the context of landmark experiments in a student friendly format built on pedagogy not usually found in immunology texts *Biomedical Index to PHS-supported Research: pt. A. Subject access A-H* , 1992 **Regulation of Hematopoietic and Leukemic Stem Cells** Kenneth Demire Gibbs, 2010 Hematopoiesis is organized as a cellular hierarchy in which long term self renewing hematopoietic stem cells HSC give rise to all lineages of blood cells for the lifetime of an organism Following the prospective isolation of mouse HSC in the late 1980s research over the past two decades has focused on refining the phenotypic compartment where HSC reside and identifying the numerous cell intrinsic and extrinsic mechanisms important for their maintenance Many of these pathways are misappropriated in hematopoietic malignancies such as leukemia It has been proposed that like normal hematopoiesis leukemia is organized as a cellular hierarchy in which a leukemic stem cell population LSC is uniquely able to self renew and gives rise to the heterogeneous lineages of cells that compose the tumor This thesis will cover the mechanisms regulating the behavior of normal hematopoietic stem cells and leukemic stem cells First phospho specific flow cytometry was utilized to define the

responsiveness of human HSC to cytokine stimulation This direct biochemical analysis demonstrated that HSC respond directly and rapidly to a broader number of direct stimuli in vitro and in vivo than previously appreciated This included Granulocyte Colony Stimulating Factor G CSF a cytokine used clinically to mobilize HSC to the peripheral blood prior to bone marrow transplantation The direct HSC response to G CSF is shown to affect the behavior of the HSC pool in vitro causing cell cycle entry and increased proliferation and in vivo negatively regulating active hematopoiesis in the short term Thus it is proposed that cytokines long known to impact the function of mature lineage cells also are important for the steady state regulation of HSC activity Next two mouse models of AML were utilized to determine the mechanisms important for regulation of LSC activity It is demonstrated that the catalytic p110 lower case delta subunit of Phosphoinositide 3 kinase PI3K which is constitutively activated and drives proliferation in human AML blasts is dispensable for de novo leukemogenesis and LSC activity in AML driven by retroviral transfer of MLL AF9 or HoxA9 Meis1 H9M oncogenes into early hematopoietic progenitors Finally the LSC in H9M AML are identified Surprisingly multiple phenotypic compartments were equally enriched for LSC activity This was also the case when LSC activity in MLL AF9 driven AML was assessed Putative genetic LSC maintenance signatures for each model were also identified There was both overlap and stark contrast in cell surface phenotypes of the LSC enriched compartments and the genetic LSC maintenance signatures in these closely related leukemias These data suggest that like normal hematopoiesis a hierarchy does exist in which self renewing cells give rise to terminally differentiated progeny However unlike HSC activity which can be isolated to a single compartment by cell surface phenotype that is commonly regulated between individuals LSC activity is a cell state that can be independent of surface phenotype and with context specific regulatory mechanisms
