

Regulation Of Hepatic Metabolism

Frank Lundquist, Niels Tygstrup

Regulation Of Hepatic Metabolism:

Aspects of Regulation of Hepatic Metabolism Raymond S. Ochs, 1979 Regulation of Hepatic Metabolism, 1974

Regulation of Hepatic Metabolism K. Jungermann, F.C. Kauffman, R.G. Thurman, 2012-12-06 The liver is an exceptionally complex and diverse organ that functions both as an exocrine and an endocrine gland. It secretes bile which contains many constituents in addition to bile salts and it synthesizes and releases many substances in response to the body's demands including prohormones, albumin, clotting factors, glucose, fatty acids, and various lipoproteins. It has a dual blood supply providing a rich mixture of nutrients and other absorbed substances via the portal vein and oxygen-rich blood via the hepatic artery. This functional heterogeneity is accompanied by cellular heterogeneity. The liver contains many cell types including hepatic parenchymal cells, Kiipffer cells, Ito cells, and endothelial cells. The most abundant cell type, the parenchymal cells, are biochemically and structurally heterogeneous. The cells in the oxygen-rich areas of the portal triad appear more dependent on oxidative metabolism, whereas those around the central vein, pericentral, perivenous, or centrolobular areas are more dependent upon an anaerobic mechanism. Throughout this volume, the latter three terms are used synonymously by various authors to indicate the five to eight layers of cells radiating from the central vein. Structural and metabolic heterogeneity of hepatic parenchymal cells has been demonstrated by a variety of approaches including histochemical, ultrastructural, and ultramicrobiochemical studies. This microheterogeneity is linked to the physiological functions of the liver and its response to injurious substances. *Regulation of Hepatic Metabolism* Frank Lundquist, Niels Tygstrup, 1974 **Research Awards**

Index, 1982 **Regulation of Hepatic Metabolism Through PGC-1 [alpha]-mediated Pathways** Linda Grasfeder, 2007

PGC 1alpha is a transcriptional coactivator selectively expressed in tissues with high metabolic demands and induced by a variety of metabolic stressors including cold, exercise, and fasting. When expressed, PGC 1alpha can coactivate a number of transcription factors to coordinately activate metabolic pathways that supply tissues and the body with necessary nutrients. PGC 1alpha has emerged as a master controller of mitochondria and many of the processes focused within them, including oxidative phosphorylation, fatty acid oxidation, the TCA cycle, and free radical scavenging. PGC 1alpha also induces gluconeogenesis and expression of glucose transporters, thereby regulating blood glucose levels. Given this integral role in modulating energy homeostasis, understanding how PGC 1alpha functions and what factors regulate its activity could help identify processes and proteins that malfunction in various metabolic disorders. **The Warburg Effect: Regulation Under Siege: The Intertwined Pathways in Health and Disease** Concetta Bubici, Salvatore Papa, 2019-10-17 Many cells, including immune, neuronal, cancer, and stem cells, become dependent on aerobic glycolysis to escape apoptosis and accommodate their bioenergetics needs. How this metabolic change, also known as the Warburg effect, is regulated remains largely unknown. The Warburg effect has been widely investigated in cancer cells where it was first observed with the aim of decoding the molecular networks controlling its activation for therapeutic purposes. This Research Topic aimed to discuss

and review all the intracellular signaling regulating the Warburg effect in cancerous and normal non cancerous cells though original research articles mini reviews and reviews **Studies on the Hormonal Regulation of Hepatic Metabolism**
