Relativistic Electrodynamics And Differential Geometry:

Relativistic Electrodynamics and Differential Geometry Stephen Parrott, 2012-12-06 The aim of this book is to provide a short but complete exposition of the logical structure of classical relativistic electrodynamics written in the language and spirit of coordinate free differential geometry The intended audience is primarily mathematicians who want a bare bones account of the foundations of electrodynamics written in language with which they are familiar and secondarily physicists who may be curious how their old friend looks in the new clothes of the differential geometric viewpoint which in recent years has become an important language and tool for theoretical physics This work is not intended to be a textbook in electrodynamics in the usual sense in particular no applications are treated and the focus is exclusively the equations of motion of charged particles Rather it is hoped that it may serve as a bridge between mathematics and physics Many non physicists are surprised to learn that the correct equation to describe the motion of a classical charged particle is still a matter of some controversy The most mentioned candidate is the Lorentz Dirac equation t However it is experimentally unverified is known to have no physically reasonable solutions in certain circumstances and its usual derivations raise serious foundational issues Such difficulties are not extensively discussed in most electrodynamics texts which quite naturally are oriented toward applying the well verified part of the subject to concrete problems Non-Inertial Frames and Dirac

Observables in Relativity Luca Lusanna, 2019-07-04 Describes global non inertial frames in special and general relativity and provides a detailed description of mathematical methods **The Geometry of Minkowski Spacetime** Gregory L.

Naber, 2012-02-02 This book offers a presentation of the special theory of relativity that is mathematically rigorous and yet spells out in considerable detail the physical significance of the mathematics It treats in addition to the usual menu of topics one is accustomed to finding in introductions to special relativity a wide variety of results of more contemporary origin These include Zeeman's characterization of the causal automorphisms of Minkowski spacetime the Penrose theorem on the apparent shape of a relativistically moving sphere a detailed introduction to the theory of spinors a Petrov type classification of electromagnetic fields in both tensor and spinor form a topology for Minkowski spacetime whose homeomorphism group is essentially the Lorentz group and a careful discussion of Dirac's famous Scissors Problem and its relation to the notion of a two valued representation of the Lorentz group This second edition includes a new chapter on the de Sitter universe which is intended to serve two purposes The first is to provide a gentle prologue to the steps one must take to move beyond special relativity and adapt to the presence of gravitational fields that cannot be considered negligible The second is to understand some of the basic features of a model of the empty universe that differs markedly from Minkowski spacetime but may be recommended by recent astronomical observations suggesting that the expansion of our own universe is accelerating rather than slowing down The treatment presumes only a knowledge of linear algebra in the first three chapters a bit of real analysis in the fourth and in two appendices some elementary point set topology The first edition of the book received the

1993 CHOICE award for Outstanding Academic Title Reviews of first edition a valuable contribution to the pedagogical literature which will be enjoyed by all who delight in precise mathematics and physics American Mathematical Society 1993 Where many physics texts explain physical phenomena by means of mathematical models here a rigorous and detailed mathematical development is accompanied by precise physical interpretations CHOICE 1993 his talent in choosing the most significant results and ordering them within the book can't be denied The reading of the book is really a pleasure Dutch Mathematical Society 1993

Electrodynamics Carolina C. Ilie, Zachariah S. Schrecengost, 2018-05-29 This book of problems and solutions is a natural continuation of Ilie and Schrecengost's first book *Electromagnetism Problems and Solutions* As with the first book this book is written for junior or senior undergraduate students and for graduate students who may have not studied electrodynamics yet and who may want to work on more problems and have an immediate feedback while studying This book of problems and solutions is a companion for the student who would like to work independently on more electrodynamics problems in order to deepen their understanding and problem solving skills and perhaps prepare for graduate school This book discusses main concepts and techniques related to Maxwell's equations conservation laws electromagnetic waves potentials and fields and radiation

Electrodynamics of Continua II A. Cemal Eringen, Gerard A. Maugin, 2012-12-06 This is the second volume of a two volume set presenting a unified approach to the electrodynamics of continua based on the principles of contemporary continuum of physics The first volume was devoted mainly to the development of the theory and applications to deformable solid media This volume extends the developments of the first volume to richer and newer grounds It contains discussions on fluid media magnetohydrodynamics electrodynamics and media with more complicated structures With the discussion in the last two chapters of memory dependent materials and non local E M theory the authors account for the nonlocal effects arising from motions and fields of material points at past times and at spatially distant points This discussion is included here to stimulate further research in these important fields which are presently in development stages The second volume is self contained and can be studied without the help of volume I A section summarizing the constitutive equations and the underlying physical ideas which were presented in more detail in the first volume is included This volume may be used as a basis for several graduate courses in engineering schools applied mathematics and physics departments It also contains fresh ideas and will stimulate further research in the directions the authors outline

An Introduction to Covariant Quantum Mechanics Josef Janyška, Marco Modugno, 2022-04-06 This book deals with an original contribution to the hypothetical missing link unifying the two fundamental branches of physics born in the twentieth century General Relativity and Quantum Mechanics Namely the book is devoted to a review of a covariant approach to Quantum Mechanics along with several improvements and new results with respect to the previous related literature The first part of the book deals with a covariant formulation of Galilean Classical Mechanics which stands as a suitable background for covariant Quantum Mechanics The second part deals with an

introduction to covariant Quantum Mechanics Further in order to show how the presented covariant approach works in the framework of standard Classical Mechanics and standard Quantum Mechanics the third part provides a detailed analysis of the standard Galilean space time along with three dynamical classical and quantum examples The appendix accounts for several non standard mathematical methods widely used in the body of the book

The Many Faces of Maxwell, Dirac and Einstein Equations Waldyr A. Rodrigues, Jr,Edmundo Capelas de Oliveira,2016-04-26 This book is an exposition of the algebra and calculus of differential forms of the Clifford and Spin Clifford bundle formalisms and of vistas to a formulation of important concepts of differential geometry indispensable for an in depth understanding of space time physics The formalism discloses the hidden geometrical nature of spinor fields Maxwell Dirac and Einstein fields are shown to have representatives by objects of the same mathematical nature namely sections of an appropriate Clifford bundle This approach reveals unity in diversity and suggests relationships that are hidden in the standard formalisms and opens new paths for research This thoroughly revised second edition also adds three new chapters on the Clifford bundle approach to the Riemannian or semi Riemannian differential geometry of branes on Komar currents in the context of the General Relativity theory and an analysis of the similarities and main differences between Dirac Majorana and ELKO spinor fields The exercises with solutions the comprehensive list of mathematical symbols and the list of acronyms and abbreviations are provided for self study for students as well as for classes From the reviews of the first edition The text is written in a very readable manner and is complemented with plenty of worked out exercises which are in the style of extended examples their book could also serve as a textbook for graduate students in physics or mathematics Alberto Molgado Mathematical Reviews 2008 k

[Foundations of Classical Electrodynamics](#) Friedrich W Hehl,Yuri N. Obukhov,2012-12-06 In this book we display the fundamental structure underlying classical electrodynamics i e the phenomenological theory of electric and magnetic effects The book can be used as a textbook for an advanced course in theoretical electrodynamics for physics and mathematics students and perhaps for some highly motivated electrical engineering students We expect from our readers that they know elementary electrodynamics in the conventional 1 3 dimensional form including Maxwell s equations More over they should be familiar with linear algebra and elementary analysis including vector analysis Some knowledge of differential geometry would help Our approach rests on the metric free integral formulation of the conservation laws of electrodynamics in the tradition of F Kottler 1922 E Cartan 1923 and D van Dantzig 1934 and we stress in particular the axiomatic point of view In this manner we are led to an understanding of why the Maxwell equations have their specific form We hope that our book can be seen in the classical tradition of the book by E J Post 1962 on the Formal Structure of Electromagnetics and of the chapter Charge and Magnetic Flux of the encyclopedia article on classical field theories by C Truesdell and R A Toupin 1960 including R A Toupin s Bressanone lectures 1965 for the exact references see the end of the introduction on page 11
