## **Rubber Product Failure:**

*Rubber Product Failure* Roger P. Brown, 2002 Rubber components are used in many demanding applications from tyres and seals to gloves and medical devices and failure can be catastrophic This review of Rubber Product Failure outlines and illustrates the common causes of failure while addressing ways of avoiding it There has been increasing pressure to improve performance so that rubbers can be used at higher temperatures and in harsher environments For example the under the bonnet temperature has increased in some vehicles and new medical devices require longer lifetimes in potentially degrading biological fluids The expectations of tyre performance in particular are increasing and retreads have been in the spotlight for failures The definition of failure depends on the application For example a racing car engine seal that lasts for one race may be acceptable but in a normal car a life span of 10 years is more reasonable If appearance is critical as in surface coatings and paints then discolouration is failure whilst in seals leakage is not acceptable Each rubber product must be fit for the use specified by the consumer Failure analysis is critical to product improvement the cause of the problem can be much harder to find It can range from a design fault to poor material selection to processing problems to manufacturing errors such as poor dimensional tolerances to poor installation product abuse and unexpected service conditions The rubber technologist must become a detective gathering evidence understanding the material type and using deductive reasoning Testing and analysis of failed materials and components add to the information available for failure analysis For example stored aged tyres appeared superficially to be alright for use but on drum testing small cracks grew more quickly than in new tyres leading to rapid failure in service Quality control procedures such as product inspection testing and material quality checks can help to reach 100 percent reliability In critical applications such as electricians gloves for high voltage working gloves are inspected before each use while engine seals may be routinely replaced before the expected lifetime to avoid problems in the literature is not high However several reviews have been written on specific products and references can be found at the end of this review Around 400 abstracts from papers in the Polymer Library are included with an index Subjects covered include tyre wear and failure seals engine components rubber bonding failure rubber failure due to chloramine in water tank treads gloves and condoms medical devices and EPDM roofing membranes

### **Failure of Plastics and Rubber Products D.**

Wright, 2001-06 Plastics and rubbers together make up the most adaptable and varied class of materials available to product designers They may be transparent or opaque rigid or flexible lightweight insulating and weatherproof They are used in almost every industry and in every part of the home Applications range from the humble hot water bottle to the sheathing on a high voltage cable and from a simple scrubbing brush to a tank for storing hydrochloric acid Products may be disposable e g packaging goods or intended to last for decades such as a buried sewage pipe However it is this very diversity which makes materials selection so difficult and appropriate design so important Indeed the one thing that all these particular products have in common is their presence in this book of failures Failures due to degradation may result from exposure to the

weather or an aggressive operating environment Alternatively they may be caused by the introduction of an external agent unforeseen by the product designer They may be rapid or very slow and they may result from a combination of factors In this book Dr Wright describes the following mechanisms of polymer degradation and then illustrates each failure mechanism with a number of case studies Thermo oxidation Photo oxidation Degradation due to ionising radiation Chemical attack Environmental stress cracking Other miscellaneous effects including treeing electrochemical degradation and biodegradation Many of the case studies are based on Dr Wrights own experiences whilst working at Rapra In each case he describes the circumstances of the failure and discusses both the consequences of the failure and the lessons that may be learned from it Most of the failed products are familiar to us all and his style is both readable and informative Photographs are included where available The book will be essential reading for designers engineers product specifiers and forensic engineers Materials suppliers and processors will also benefit from the pragmatic analysis and advice it contains It will also be of value to all students of polymer science and technology providing an essential insight into the practical application of plastics and rubbers and the potential problems Finally it will be of interest to a much broader readership including anyone who ever wondered why things break and it should become a standard reference work in all technical libraries This book was written with the support of the UK Department of Trade and Industry It is intended to raise awareness of the causes and consequences of polymer product failures in order to reduce the future incidences of such failures and their considerable costs to industry
