Deep Thinking: What Mathematics Can Teach Us About The Mind William Byers, 2014-09-22 There is more than one way to think Most people are familiar with the systematic rule based thinking that one finds in a mathematical proof or a computer program But such thinking does not produce breakthroughs in mathematics and science nor is it the kind of thinking that results in significant learning Deep thinking is a different and more basic way of using the mind It results in the discontinuous aha experience which is the essence of creativity It is at the heart of every paradigm shift or reframing of a problematic situation The identification of deep thinking as the default state of the mind has the potential to reframe our current approach to technological change education and the nature of mathematics and science For example there is an unbridgeable gap between deep thinking and computer simulations of thinking Many people suspect that such a gap exists but find it difficult to make this intuition precise This book identifies the way in which the authentic

intelligence of deep thinking differs from the artificial intelligence of big data and analytics Deep thinking is the essential ingredient in every significant learning experience which leads to a new way to think about education It is also essential to the construction of conceptual systems that are at the heart of mathematics and science and of the technologies that shape the modern world Deep thinking can be found whenever one conceptual system morphs into another The sources of this study include the cognitive development of numbers in children neuropsychology the study of creativity and the historical development of mathematics and science The approach is unusual and original It comes out of the author's lengthy experience as a mathematician teacher and writer of books about mathematics and science such as *How Mathematicians Think Using Ambiguity Contradiction and Paradox to Create Mathematics* and *The Blind Spot Science and the Crisis of Uncertainty* **Sesame Street Numbers 1-20 Flash Cards** Learning Horizons,2009-06 **SESAME STREET LEARNING FLASH CARDS AND CARD GAMES** *Interaction of Media, Cognition, and Learning* Gavriel Salomon,2012-12-06 The educational use of television film and related media has increased significantly in recent years but our fundamental understanding of how media communicate information and which instructional purposes they best serve has grown very little In this book the author advances an empirically based theory relating media's most basic mode of presentation their symbol systems to common thought processes and to learning Drawing on research in semiotics cognition and cognitive development psycholinguistics and mass communication the author offers a number of propositions concerning the particular kinds of mental processes required by and the specific mental skills enhanced by different symbol systems He then describes a series of controlled experiments and field and cross cultural studies designed to test these propositions Based primarily on the symbol system elements of television and film these studies illustrate under what circumstances and with what types of learners certain kinds of learning and mental skill development occur These findings are incorporated into a general scheme of reciprocal interactions among symbol systems learners cognitions and their mental activities and the implications of these relationships for the design and use of instructional materials are explored Congressional Record United States.
