Methods Of Cell Separation:

Methods of Cell Separation P.T. Sharpe, 1988-05-01 *Methods of Cell Separation* brings to the attention of researchers at all levels the variety of methods available for separating viable populations of cells. Methods are grouped into 3 categories based on the criteria of separation: namely size or density, non specific surface properties and specific surface properties. The principle of each method is described together with general and where possible specific protocols for conducting cell separation experiments. A central theme of the book is the separation of populations of blood lymphocytes which is used as an example for each method. *Methods of Cell Separation* is distinguished by three powerful assets: descriptions of the majority of cell separation methods currently being used; details of the experimental procedures involved in each method; and comparisons of the different methods for separating cell populations with particular reference to blood lymphocytes. An excellent addition to a distinguished series and extremely useful as a laboratory manual.

Methods of Cell Separation Nicholas Catsimpoolas, 2013-11-11 Presently the need for methods involving separation, identification and characterization of different kinds of cells is amply realized among immunologists, hematologists, cell biologists, clinical pathologists and cancer researchers. Unless cells exhibiting different functions and stages of differentiation are separated from one another it will be exceedingly difficult to study some of the molecular mechanisms involved in cell recognition, specialization, interactions, cytotoxicity and transformation. Clinical diagnosis of diseased states and use of isolated cells for therapeutic e.g. immunotherapy or survival e.g. transfusion purposes are some of the pressing areas where immediate practical benefits can be obtained by applying cell separation techniques. However the development of such useful methods is still in its infancy. A number of good techniques exist based either on the physical or biological properties of the cells and these have produced some valuable results. Still others are to be discovered. Therefore the purpose of this open end treatise is to acquaint the reader with some of the basic principles, instrumentation and procedures presently in practice at various laboratories around the world and to present some typical applications of each technique to particular biological problems. To this end I was fortunate to obtain the contribution of certain leading scientists in the field of cell separation people who in their pioneering work have struggled with the particular problems involved in separating living cells and in some way have won.
