convection relevant to the mantle theoretical analysis of mantle dynamics and numerical analysis and methods of mantle convection The subsequent chapters concentrate on leading issues of mantle convection itself which include the energy budget of the mantle the upper mantle and lithosphere in and near the spreading center mid ocean ridge environment the dynamics of subducting slabs hot spots melting anomalies and mantle plumes and finally geochemical mantle dynamics and mixing Self contained volume starts with an overview of the subject then explores each topic in detail Extensive reference lists and cross references with other volumes to facilitate further research Full color figures and tables support the text and aid in understanding Content suited for both the expert and non expert **Nails, Noggins and Newels** Bill

Empirical Model Discovery and Theory Evaluation David F. Hendry, Jurgén A. Doornik, 2014-07-03 A synthesis of the authors groundbreaking econometric research on automatic model selection which uses powerful computational algorithms and theory evaluation Economic models of empirical phenomena are developed for a variety of reasons the most obvious of which is the numerical characterization of available evidence in a suitably parsimonious form Another is to test a theory or evaluate it against the evidence still another is to forecast future outcomes Building such models involves a multitude of decisions and the large number of features that need to be taken into account can overwhelm the researcher Automatic model selection which draws on recent advances in computation and search algorithms can create and then empirically investigate a vastly wider range of possibilities than even the greatest expert In this book leading econometricians David Hendry and Jurgén Doornik report on their several decades of innovative research on automatic model selection After introducing the principles of empirical model discovery and the role of model selection Hendry and Doornik outline the stages of developing a viable model of a complicated evolving process They discuss the discovery stages in detail considering both the theory of model selection and the performance of several algorithms They describe extensions to tackling outliers and multiple breaks leading to the general case of more candidate variables than observations Finally they briefly consider selecting models specifically for forecasting

Theoretical Concepts in Physics Malcolm S. Longair, 2003-12-04 A highly original and truly novel approach to theoretical reasoning in physics This book illuminates the

subject from the perspective of real physics as practised by research scientists It is intended to be a supplement to the final years of an undergraduate course in physics and assumes that the reader has some grasp of university physics By means of a series of seven case studies the author conveys the excitement of research and discovery highlighting the intellectual struggles to attain understanding of some of the most difficult concepts in physics Case studies include the origins of Newton's law of gravitation Maxwell's equations mechanics and dynamics linear and non linear thermodynamics and statistical physics the origins of the concepts of quanta special relativity general relativity and cosmology The approach is the same as that in the highly acclaimed first edition but the text has been completely revised and many new topics introduced The Story of Chemistry N. C. Datta, 2005 Chemistry touches every aspect of our life but we are largely ignorant of it A general reader has access to many popular books in the various areas of physics and astronomy but in the area of chemistry there is virtually no accessible material One common perception is that chemistry is a difficult subject which is partially true
