New Developments In Quantum Field Theory:

New Developments in Quantum Field Theory Poul Henrik Damgaard, Jerzy Jurkiewicz, 2006-04-11 Quantum field theory is one of most central constructions in 20th century theoretical physics and it continues to develop rapidly in many different directions The aim of the workshop New Developments in Quantum Field Theory which was held in Zakopane Poland June 14 20 1997 was to capture a broad selection of the most recent advances in this field The conference was sponsored by the Scientific and Environmental Affairs Division of NATO as part of the Advanced Research Workshop series This book contains the proceedings of that meeting Major topics covered at the workshop include quantized theories of gravity string theory conformal field theory cosmology field theory approaches to critical phenomena and the renormalization group matrix models and field theory techniques applied to the theory of turbulence One common theme at the conference was the use of large Nmatrix models to obtain exact results in a variety of different disciplines For example it has been known for several years that by taking a suitable double scaling limit certain string theories or two dimensional quantum gravity coupled to matter can be re obtained from the large Nexpansion of matrix models There continues to be a large activity in this area of research which was well reflected by talks given at our workshop Remarkably large Nmatrix models have very recently just a few months before our meeting been shown to have yet another deep relation to string theory

New Developments in Quantum Field Theory and Statistical Mechanics Cargèse 1976 M. Levy, 2013-06-29 The 1976 Cargèse Summer Institute was devoted to the study of certain exciting developments in quantum field theory and critical phenomena Its genesis occurred in 1974 as an outgrowth of many scientific discussions amongst the undersigned who decided to form a scientific committee for the organization of the school On the one hand various workers in quantum field theory were continuing to make startling progress in different directions On the other hand many new problems were arising from these various domains Thus we felt that 1976 might be an appropriate occasion both to review recent developments and to encourage interactions between researchers from different backgrounds working on a common set of unsolved problems An important aspect of the school as it took place was the participation of and stimulating interaction between such a broad spectrum of theorists The central topics of the school were chosen from the areas of solitons phase transitions critical behavior the renormalization group gauge fields and the analysis of nonrenormalizable field theories A noteworthy feature of these topics is the interpenetration of ideas from quantum field theory and statistical mechanics whose inherent unity is seen in the functional integral formulation of quantum field theory The actual lectures were partly in the form of tutorials designed to familiarize the participants with recent progress on the main topics of the school Others were in the form of more specialized seminars reporting on recent research

Recent Developments in Quantum Field Theory J. Ambjorn, B.J. Durhuus, J.L. Petersen, 2012-12-02 Theoretical particle physicists discuss the present status and in particular the latest developments in quantum field theory in their broadest aspects This volume contains the main lectures presented at the symposium and

reflects the contemporary status of a line of development one of whose initiators was Niels Bohr

Quantum Field Theory and Statistical Mechanics James Glimm, Arthur Jaffe, 2012-12-06 This volume contains a selection of expository articles on quantum field theory and statistical mechanics by James Glimm and Arthur Jaffe They include a solution of the original interacting quantum field equations and a description of the physics which these equations contain Quantum fields were proposed in the late 1920s as the natural framework which combines quantum theory with relativity They have survived ever since The mathematical description for quantum theory starts with a Hilbert space H of state vectors Quantum fields are linear operators on this space which satisfy nonlinear wave equations of fundamental physics including coupled Dirac Maxwell and Yang Mills equations The field operators are restricted to satisfy a locality requirement that they commute or anti commute in the case of fermions at space like separated points This condition is compatible with finite propagation speed and hence with special relativity Asymptotically these fields converge for large time to linear fields describing free particles Using these ideas a scattering theory had been developed based on the existence of local quantum fields

Nonperturbative Quantum Field Theory G. Hooft, A. Jaffe, G. Mack, P.K. Mitter, R. Stora, 2012-12-06 During the past 15 years, quantum field theory and classical statistical mechanics have merged into a single field, and the need for nonperturbative methods for the description of critical phenomena in statistical mechanics as well as for problems in elementary particle physics are generally acknowledged. Such methods formed the central theme of the 1987 Cargèse Advanced Study Institute on Nonperturbative Quantum Field Theory. The use of conformal symmetry has been of central interest in recent years and was a main subject at the ASI.

Conformal invariant quantum field theory describes statistical mechanical systems exactly at a critical point and can be analysed to a remarkable extent by group theoretical methods. Very strong results have been obtained for 2 dimensional systems. Conformal field theory is also the basis of string theory which offers some hope of providing a unified theory of all interactions between elementary particles. Accordingly a number of lectures and seminars were presented on these two topics. After systematic introductory lectures conformal field theory on Riemann surfaces orbifolds sigma models and application of loop group theory and Grassmannians were discussed and some ideas on modular geometry were presented. Other lectures combined traditional techniques of constructive quantum field theory with new methods such as the use of index theorems and infinite dimensional Kac Moody symmetry groups. The problems encountered in a quantum mechanical description of black holes were discussed in detail.
