Abstract: In the article, dosimetry of ionizing radiation considers the properties of ionizing radiation, physical quantities describing the field of radiation or the interaction of radiation with substances, as well as the principles and methods of their determination.

Dosimetry deals with the physical quantities associated with expected radiation exposure. These quantities are usually called dosimetric. The established relationship between the measured physical quantity and the expected radiation effect is the most important feature of dosimetric quantities. Without this connection, dosimetric measurements lose their meaning.

Key words: Ionizing radiation, radiation effect, dosimetry, nuclide activity in a radioactive source, exposure dose rate.

Introduction

The main cause of radiation exposure is the absorption of ionizing radiation energy by the irradiated object, and the dose as a measure of absorbed energy is the main dosimetric quantity.

Quantification of the radiation dose affecting a living organism is necessary, first of all, for the identification, assessment and prevention of possible radiation hazards for humans. If hygienists and radiobiologists need to answer the question of what are the maximum permissible levels of radiation from the point of view of biological risk, dosimeters must ensure the correct measurement (determination) of these levels.

The development of dosimetry was initially fully determined by the need to protect people from the harmful effects of ionizing radiation. Soon after the discovery of X-rays (1895), its harmful effects

Dewji, Nolan E. Hertel, 2019-04-02 Although many radiation protection scientists and engineers use dose coefficients few know the origin of those dose coefficients This is the first book in over 40 years to address the topic of radiation protection dosimetry in intimate detail Advanced Radiation Protection Dosimetry covers all methods used in radiation protection dosimetry including advanced external and internal radiation dosimetry concepts and regulatory applications This book is an ideal reference for both scientists and practitioners in radiation protection and students in graduate health physics and medical physics courses Features A much needed book filling a gap in the market in a rapidly expanding area Contains the history evolution and the most up to date computational dosimetry models Authored and edited by internationally recognized authorities and subject area specialists Interrogates both the origins and methodologies of dose coefficient calculation Incorporates the latest international guidance for radiation dosimetry and protection

, 1991 *Toxicology of the Lung* Donald E. Gardner, James D Crapo, Roger O. McClellan, 2000-01-20 Thoroughly revised and updated the third edition of Toxicology of the Lung brings together the latest accomplishments and advancements in concepts approaches and procedures now used to evaluate the risks associated with airborne contaminants With chapters from leading authorities including nine new chapters and a number of new topic areas this edition describes how and why the lung and respiratory system respond as they do to toxicants and provides a clear understanding of human health risks associated with chemical exposure This one of a kind reference on inhalation toxicology will be invaluable to all professionals in academia industry clinics research laboratories and government agencies

Radiation Protection Jacob Shapiro, 2002

This highly successful manual has served for nearly three decades as the definitive guide to the safe use of radioactive materials Completely revised and updated the fourth edition presents a new dimension by adding coverage of nonionizing radiation and is thus concerned with the entire field of radiation protection The author takes the novel approach of introducing the whole range of energies possessed by particles and electromagnetic waves at the beginning of the text thus integrating coverage of ionizing and nonionizing radiation rather than considering them as two separate disciplines He goes on to cover the entire spectrum of radiation sources including radionuclides x ray machines accelerators nuclear reactors power lines microwave towers and cellular phones With its expanded coverage including a broader focus on public health issues this new volume will serve as an important training and reference resource not only for research scientists physicians and engineers but for regulatory officials attorneys engineers and environmental health and safety professionals The breadth of citations alone makes this resource invaluable

Human Exposure to Pollutants via Dermal Absorption and Inhalation

Mihalis Lazaridis, Ian Colbeck, 2010-03-22 Estimates of the air pollution health impact play a crucial role in environmental protection These estimates require accurate data on the pollutant exposure and dose to the population as well as the dose

response relationships to calculate the health impact From an air quality manager s perspective there is concern about the validity and accuracy of these calculations There is a need for information and possible ways to adjust the assessment One important topic for air quality managers is to understand the relative contribution of sources to the total exposure These sources may be coming from both different outdoor sources from sectors such as transport industry and energy industries and from a number of indoor sources such as heating ventilation and indoor activities as well as out gassing from building material and furniture Indoor air quality is now drawing the attention of policy makers The basic right to and importance of healthy indoor air was emphasized by the World Health Organization as early as 2000 and several countries have described target concentrations for various pollutants The WHO Air Quality Guidelines 2005 recommended the development of specific guidelines for indoor air quality and these are expected to be published soon Indoor air pollutants have not been as extensively monitored as outdoor air pollutants and the evidence base for contributions to health effects needs to be strengthened

Airborne Radioactive Contamination in Inhabited Areas ,2009-08-14 For many decades investigations of the behaviour and implications of radioactive contamination in the environment have focused on agricultural areas and food production This was due to the erroneous assumption that the consequences of credible contaminating incidents would be restricted to rural areas However due to the Chernobyl accident more than 250 000 persons were removed from their homes demonstrating a great need for knowledge and instruments that could be applied to minimise the manifold adverse consequences of contamination in inhabited areas Also today the world is facing a number of new threats including radiological terrorism which would be likely to take place in a city where most people would become directly affected A recent report from the US Commission on the Prevention of Weapons of Mass Destruction Proliferation and Terrorism concludes that it is most likely that a large radiological or even nuclear terror attack on a major city somewhere in the world will occur before 2013 For the first time ever the specific problems of airborne radioactive contamination in inhabited areas are treated in a holistically covering treatise pinpointing factorial interdependencies and describing instruments for mitigation The state of the art knowledge is here explained in *Airborne Radioactive Contamination in Inhabited Areas* y leading scientists in the various disciplines of relevance Unique holistic description of airborne radioactive contamination of inhabited areas and its consequences State of the art information on problems associated with both accidental and malicious contamination events in particularly dirty bombs Detailed description of processes and parameters governing the severity of contaminating incidents Written by key experts in the world

Nanotechnology for Environmental Remediation Sabu Thomas,Merin Sara Thomas,Laly A. Pothan,2022-08-02 Nanotechnology for Environmental Remediation Comprehensive resource on using nanomaterials to alleviate environmental pollution Contaminated land soil and water pose a threat to the environment and health These sites require immediate action in terms of assessing pollution and new remediation strategies Nanotechnology for Environmental Remediation helps readers understand the potential of nanotechnology in resolving the

growing problem of environmental contamination The specific aim of this book is to provide comprehensive information relating to the progress in the development of functional nanomaterials and nanocomposites which are used for the environmental remediation of a variety of contaminants The work deals with the different aspects of nanotechnology in water air and soil contamination and presents the recent advances with a focus on remediation Core topics discussed in the work include Nanotechnology that can be used to engineer and tailor particles for specific environmental remediation applications A big picture conceptual understanding of environmental remediation methods for researchers environmentalists and professionals involved in assessing and developing new nano based strategies A detailed approach towards the different remediation procedures by various nanomaterials such as metal nanoparticles polymeric nanoparticles carbon nanotubes and dendrimers The societal impact that nanotechnology has on the environment Chemists and biotechnologists can use Nanotechnology for Environmental Remediation as a comprehensive reference work for thoroughly understanding this new type of technology and why it is so important when considering environmental remediation efforts Due to the practical application of nanotechnologies environmental organizations and agencies can also both utilize the work to explore new and more effective ways of doing things both now and into the future as nanotechnology becomes more common

Environmental Radionuclides Klaus Froehlich, 2009-09-23 *Environmental Radionuclides* presents a state of the art summary of knowledge on the use of radionuclides to study processes and systems in the continental part of the Earth's environment It is conceived as a companion to the two volumes of this series which deal with isotopes as tracers in the marine environment Livingston Marine Radioactivity and with the radioecology of natural and man made terrestrial systems Shaw Radioactivity in Terrestrial Ecosystems Although the book focuses on natural and anthropogenic radionuclides radioactive isotopes it also refers to stable environmental isotopes which in a variety of applications especially in hydrology and climatology have to be consulted to evaluate radionuclide measurements in terms of the ages of groundwater and climate archives respectively The basic principles underlying the various applications of natural and anthropogenic radionuclides in environmental studies are described in the first part of the book The book covers the two major groups of applications the use of radionuclides as tracers for studying transport and mixing processes and as time markers to address problems of the dynamics of such systems manifested commonly as the so called residence time in these systems The applications range from atmospheric pollution studies via water resource assessments to contributions to global climate change investigation The third part of the book addresses new challenges in the development of new methodological approaches including analytical methods and fields of applications A state of the art summary of knowledge on the use of radionuclides Conceived as a companion to the two volumes of this series which deal with isotopes as tracers [The Toxicology of Carbon Nanotubes](#) Kenneth Donaldson (Toxicologist), 2012-06-21 The first book on this subject invaluable to researchers and professionals involved with toxicology risk assessment and nanotube physics
