Spencer,2012-12-06 The quest for high resolution has preoccupied radio astronomers ever since radio waves were first detected from space fifty years ago This venture was par ticularly stimulated by the discovery of quasars and led to the development of interferometer techniques using baselines of transglobal dimensions These meth ods have become known as Very Long Baseline Interferometry VLBI Arrays of radio telescopes situated all over the Earth or even in space are regularly used for researches in radio astronomy reaching resolutions as small as a fraction of a milli arcsecond The technique also allows the measurement of the positions of the radio telescopes to a few millimeters and so VLBI has become a major tool in geodesy and the study of the rotation of the Earth VLBI has now passed the pioneer stage and is becoming a standard facility available to astronomers and geodesists requiring the coordination of the operations of indpendently owned radio telescopes around the world In Europe observatories from England Federal Republic of Germany France Italy Poland Sweden and The Netherlands are coordinated in their VLBI activity by the European VLBI Network Consortium EVN The Programme Committee of the EVN allocates time to scientific projects on a routine basis three times a year The Unites States has a similar arrangement of a network of independent radio observatories and joint experiments using Global Network are often made *Interferometry and Synthesis in Radio Astronomy* A. Richard Thompson,James M. Moran,George W.
