Robot Hands And The Mechanics Of Manipulation:

Robot Hands and the Mechanics of Manipulation Matthew T. Mason, J. Kenneth Salisbury, 1985-01 Robot Hands and the Mechanics of Manipulation explores several aspects of the basic mechanics of grasping pushing and in general manipulating objects It makes a significant contribution to the understanding of the motion of objects in the presence of friction and to the development of fine position and force controlled articulated hands capable of doing useful work In the book's first section kinematic and force analysis is applied to the problem of designing and controlling articulated hands for manipulation The analysis of the interface between fingertip and grasped object then becomes the basis for the specification of acceptable hand kinematics A practical result of this work has been the development of the Stanford JPL robot hand a tendon actuated 9 degree of freedom hand which is being used at various laboratories around the country to study the associated control and programming problems aimed at improving robot dexterity Chapters in the second section study the characteristics of object motion in the presence of friction Systematic exploration of the mechanics of pushing leads to a model of how an object moves under the combined influence of the manipulator and the forces of sliding friction The results of these analyses are then used to demonstrate verification and automatic planning of some simple manipulator operations Matthew T Mason is Assistant Professor of Computer Science at Carnegie Mellon University and coeditor of Robot Motion MIT Press 1983 J Kenneth Salisbury Jr is a Research Scientist at MIT's Artificial Intelligence Laboratory and president of Salisbury Robotics Inc Robot Hands and the Mechanics of Manipulation is 14th in the Artificial Intelligence Series edited by Patrick Henry Winston and Michael Brady

From Robot to Human Grasping Simulation Beatriz León, Antonio Morales, Joaquín Sancho-Bru, 2013-09-29 The human hand and its dexterity in grasping and manipulating objects are some of the hallmarks of the human species For years anatomic and biomechanical studies have deepened the understanding of the human hand's functioning and in parallel the robotics community has been working on the design of robotic hands capable of manipulating objects with a performance similar to that of the human hand However although many researchers have partially studied various aspects to date there has been no

comprehensive characterization of the human hand's function for grasping and manipulation of everyday life objects. This monograph explores the hypothesis that the confluence of both scientific fields, the biomechanical study of the human hand and the analysis of robotic manipulation of objects, would greatly benefit and advance both disciplines through simulation. Therefore, in this book, the current knowledge of robotics and biomechanics guides the design and implementation of a simulation framework focused on manipulation interactions that allows the study of the grasp through simulation. As a result, a valuable framework for the study of the grasp with relevant applications in several fields such as robotics, biomechanics, ergonomics, rehabilitation, and medicine has been made available to these communities.

Robot Hands And Multi-fingered Haptic Interfaces: Fundamentals And Applications Haruhisa Kawasaki, 2015-03-04. Robot Hands and Multi Fingered Haptic Interfaces is a monograph focusing on the comparison of human hands with robot hands, the fundamentals behind designing and creating the latter, and robotics' latest advancements in haptic technology. This work discusses the design of robot hands, contact models, grasping, kinematic models, constraint dynamic models of the multi-fingered hand, the stability theorem of non-linear control systems, robot hand control design, and control of multi-fingered haptic interfaces application systems using multi-fingered haptic interfaces and telecontrol of robot hands using a multi-fingered haptic interface. Robot Hands and Multi Fingered Haptic Interfaces is intended mainly for readers who have a foundation in basic robot arm engineering. To understand robot hand manipulation, readers must study kinematic constraint models of fingers, hand dynamics with constraints, stability theorems of non-linear control, and multi-fingered hand control; this book will benefit readers' understanding of this full range of issues regarding robot hand manipulation.

Robotics Bruno Siciliano, Lorenzo Sciavicco, Luigi Villani, Giuseppe Oriolo, 2010-08-20. Based on the successful *Modelling and Control of Robot Manipulators* by Sciavicco and Siciliano (Springer 2000), *Robotics* provides the basic know-how on the foundations of robotics modelling, planning, and control. It has been expanded to include coverage of mobile robots, visual control, and motion planning. A variety of problems is raised throughout, and the proper tools to find engineering-oriented solutions are introduced and explained. The text includes coverage of fundamental topics like kinematics and trajectory planning and related technological aspects, including actuators and sensors. To impart practical skill, examples and case studies are carefully worked out and interwoven through the text, with frequent resort to simulation. In addition, end-of-chapter exercises are proposed, and the book is accompanied by an electronic solutions manual containing the MATLAB code for computer problems; this is available free of charge to those adopting this volume as a textbook for courses.

Dextrous Robot Hands Subramanian T. Venkataraman, Thea Iberall, 2012-12-06. Manipulation using dextrous robot hands has been an exciting yet frustrating research topic for the last several years. While significant progress has occurred in the design, construction, and low-level control of robotic hands, researchers are up against fundamental problems in developing algorithms for real-time computations in multi-sensory processing and motor control. The aim of this book is to explore parallels in sensorimotor

integration in dextrous robot and human hands addressing the basic question of how the next generation of dextrous hands should evolve By bringing together experimental psychologists kinesiologists computer scientists electrical engineers and mechanical engineers the book covers topics that range from human hand usage in prehension and exploration to the design and use of robotic sensors and multi fingered hands and to control and computational architectures for dextrous hand usage While the ultimate goal of capturing human hand versatility remains elusive this book makes an important contribution to the design and control of future dextrous robot hands through a simple underlying message a topic as complex as dextrous manipulation would best be addressed by collaborative interdisciplinary research combining high level and low level views drawing parallels between human studies and analytic approaches and integrating sensory data with motor commands As seen in this text success has been made through the establishment of such collaborative efforts The future will hold up to expectations only as researchers become aware of advances in parallel fields and as a common vocabulary emerges from integrated perceptions about manipulation

Robots and Biological Systems: Towards a New Bionics? Paolo Dario,Giulio Sandini,Patrick Aebischer,2012-12-06 Bionics

evolved in the 1960s as a framework to pursue the development of artificial systems based on the study of biological systems. Numerous disciplines and technologies including artificial intelligence and learning devices, information processing systems architecture and control, perception, sensory mechanisms and bioenergetics contributed to bionics research. This volume is based on a NATO Advanced Research Workshop within the Special Programme on Sensory Systems for Robotic Control held in Il Ciocco, Italy, in June 1989. A consensus emerged at the workshop and is reflected in the book on the value of learning from nature in order to derive guidelines for the design of intelligent machines which operate in unstructured environments. The papers in the book are grouped into seven chapters: vision and dynamic systems, hands and tactile perception, locomotion, intelligent motor control, design technologies, interfacing robots to nervous systems and robot societies, and self organization.
