Sobh,2006 The underlying mathematical representation of complex robotic and manufacturing computer controlled systems is still insufficient to create a set of models which accurately captures the dynamics of the system over the entire range of system operation We remain in a situation where we must trade of the accuracy of our models with the manageability of the models Closed form solutions of mathematical models are almost exclusively limited to linear system models Computer simulation of non linear hybrid and discrete event models provide a means for online design of robotic control systems Guarantees of system performance are limited to those regions where the robustness conditions apply These conditions may not apply during start up and shutdown or during periods of anomalous operation Attempts have been made to model low and high level system changes in automated and robotic systems as discrete event dynamic systems DEDS and hybrid systems Several attempts to improve modelling capabilities are focused on mapping the continuous world into a discrete one However repeated results are available which indicate that large interactive systems evolve into states where minor events can lead to a catastrophe Discrete event and hybrid systems have been used in the manufacturing and automation domains to model system state changes within a process Timed and untimed petri nets and state automata in addition to Markovian stochastic perturbation and other models have been used extensively to model and control automated manufacturing systems High level DEDS controllers have also been to guide the behaviour of

complete shop floor automation a lights out factory where workers initially set up all machines turn off the lights lock the door and the machine churns up the parts remains an unfulfilled dream Yet when we look at the enormity of the process of automation and integration even for the most simply conceived part factory we can recognize that automation has been applied and is being applied more so when it made sense from a cost benefit standpoint It is our nature to be dissatisfied with near term progress but when we realize how short a time the tools to do that automation have been available the progress is clearly noteworthy considering the multitudes of factors and the environment we have to deal with Most of the automation problems we confront in today's environment are multidisciplinary in nature They require not just the knowledge and experience in various distinct fields but good cooperation from different disciplined organizations to adequately comprehend and solve such problems In Volume III we have many examples that reflect the current state of the art techniques of robotics and plant automation The papers for Volume III have been arranged in a logical order of automation planning automated assembly robot programming and simulation control motion coordination communication and networking to factories of the future
