**The Role of Air-Sea Exchange in Geochemical Cycling** Patrick

Buat-Menard,1986-09-30     Marine Geochemistry Roy Chester,2012-12-06 The past two or three decades have seen many important advances in our knowledge of the chemistry physics geology and biology of the oceans It has also become apparent that in order to understand the manner in which the oceans work as a chemical system it is necessary to use a framework which takes account of these interdisciplinary advances Marine geochemistry has been written in response to the need for a single state of the art text that addresses the subject of treating the sea water sediment and rock reservoirs as a unified system In taking this approach a process orientated framework has been adopted in which the emphasis is placed on identifying key processes operating within the unified ocean In doing this particular attention has been paid to making the text accessible to students from all disciplines in such a way that future advances can readily be understood I would like to express my thanks to those people who have helped with the writing of this volume In particular I wish to put on record my sincere appreciation of extremely helpful suggestions made by Professor John Edmond FRS In addition I thank Dr S Rowlett for his comments on the sections covering the geochemistry of oceanic sediments and Dr G Wolff for his invaluable advice on the organic geochemistry of biota water and sediments It is a great pleasure to acknowledge the help of Dr K J T

*Transport at the Air-Sea Interface* Christoph S. Garbe,Robert A. Handler,Bernd Jähne,2008-06-30 Predictions of our future climate vary greatly with detailed forecasts still subject to debate One key uncertainty is caused by the lack of our present knowledge of transport processes in the air water interface which poses the main transfer resistance between the oceans and atmosphere Modeling and predictions of our global climate can only be improved by gaining a more complete understanding of the mechanisms involved in transporting energy mass and momentum across the phase boundary This monograph contains selected peer reviewed post conference contributions of the International Workshop on Transport at the Air Sea Interface which took place at Heidelberg University from September 6 8 2006 The workshop brought together leading scientists from around the world bridged the gap between modeling and measurements and sparked new ideas for novel simulation and experimental efforts The focus of the monograph is on small scale processes directly at the interface and includes the topics Small scale transport processes at the air sea interface surface divergence microscale and largescale wave breaking intermittency and rain induced gas exchange Novel measurement techniques including eddy correlation measurements active and passive thermography visualization of concentration fields by fluorescent dyes profile measurements and visualization of flow fields by particle imaging velocimetry PIV Modeling of the transport across the air water interface and simulation of flow fields as well as concentration fields in the boundary layer Parameterizations of the transfer process for global modeling     Primary Productivity and Biogeochemical Cycles in the Sea Paul G. Falkowski,Avril D. Woodhead,2013-11-22 Biological processes in the oceans play a crucial role in regulating the fluxes of many important elements such as carbon nitrogen sulfur oxygen phosphorus and silicon As we come to the end of the 20th century oceanographers have increasingly focussed on how these elements are cycled within the ocean the interdependencies of

these cycles and the effect of the cycle on the composition of the earth's atmosphere and climate. Many techniques and tools have been developed or adapted over the past decade to help in this effort. These include satellite sensors of upper ocean phytoplankton distributions, flow cytometry, molecular biological probes, sophisticated moored and shipboard instrumentation, and vastly increased numerical modeling capabilities. This volume is the result of the 37th Brookhaven Symposium in Biology, in which a wide spectrum of oceanographers, chemists, biologists, and modelers discussed the progress in understanding the role of primary producers in biogeochemical cycles. The symposium is dedicated to Dr. Richard W. Eppley, an intellectual giant in biological oceanography who inspired a generation of scientists to delve into problems of understanding biogeochemical cycles in the sea. We gratefully acknowledge support from the U.S. Department of Energy, the National Aeronautics and Space Administration, the National Science Foundation, the National Oceanic and Atmospheric Administration, the Electric Power Research Institute, and the Environmental Protection Agency. Special thanks to Claire Lamberti for her help in producing this volume.

*Ocean Dynamics and the Carbon Cycle* Richard G. Williams, Michael J. Follows, 2011-07-14. This textbook for advanced undergraduate and graduate students presents a multidisciplinary approach to understanding ocean circulation and how it drives and controls marine biogeochemistry and biological productivity at a global scale. Background chapters on ocean physics, chemistry, and biology provide students with the tools to examine the range of large-scale physical and dynamic phenomena that control the ocean carbon cycle and its interaction with the atmosphere. Throughout the text, observational data is integrated with basic physical theory to address cutting-edge research questions in ocean biogeochemistry. Simple theoretical models, data plots, and schematic illustrations summarise key results and connect the physical theory to real observations. Advanced mathematics is provided in boxes and appendices where it can be drawn on to assist with the worked examples and homework exercises available online. Further reading lists for each chapter and a comprehensive glossary provide students and instructors with a complete learning package.

**Global Climate** Xavier Rodo, Francisco Comin, 2013-03-09. Uncertainty for Everyone. The one thing that is certain about the world is that the world is uncertain. I have here the question that apart of the matter living matter has to resolve in each and every one of its moments of existence. The environment of a living being is apart of the living being where it turns out the rest of the living beings live. This is the drama of life on earth. Every living individual debates with his environment exchanging matter, energy, and information in the hope of staying alive, the same as all living beings who share that same environment. The adventure of a living being of all living beings is to maintain reasonable independence in face of the fluctuations of uncertainty within the environment. The range of restrictions and mutual relationships is colossal. How is the transcendental pretension of staying alive regulated? There is an equation imposed by the laws of thermodynamics and the mathematical theory of information about the interaction of a living being with his environment which we could state like this: The complexity of a living individual plus his capacity for anticipation in respect to his environment is identical to the uncertainty of the

environment plus the capacity of that living being to change the environment

**The Long-Range Atmospheric Transport of Natural and Contaminant Substances** Anthony H. Knap, 2012-12-06 Proceedings of the NATO Advanced Research Workshop on The Long Range Atmospheric Transport of Natural and Contaminant Substances from Continent to Ocean and Continent to Continent St Georges Bermuda January 10 17 1988

*Modelling Oceanic Climate Interactions* Jürgen Willebrand, David L.T. Anderson, 2013-06-29 The ocean plays a central role in determining the climate of the earth The oceanic circulation largely controls the temporal evolution of climate changes resulting from human activities such as the increase of greenhouse gases in the atmosphere and also affects the magnitude and regional distribution of those changes On interannual and longer time scales the ocean is through its interaction with the atmosphere a source of important natural climate variations which we are only now beginning to recognise but whose cause has yet to be properly determined Chemical and biological processes in the ocean are linked to climate change particularly through interaction with the global carbon cycle A quantitative understanding of the oceanic role in the climate system requires models which include many complex processes and interactions and which are systematically verified with observations This is the objective of global research programs such as TOGA WOCE and JGOFS Coupled numerical models of the oceanic and atmospheric circulation constitute the basis of every climate simulation Increasingly it is recognized that in addition a biological chemical component is necessary to capture the pathways of carbon and other trace gases The development of such coupled models is a challenging task which needs scientists who must be cognizant of several other disciplines beyond their own specialty

**Naturally-Produced Organohalogens** Anders Grimvall, Ed W.B. de Leer, 2012-12-06 Should the production and use of chlorine and all chlorinated organic compounds be halted in view of their adverse effects on the environment and human health Those in favour argue that certain chlorinated compounds PCBs DDT CFCs etc have large negative environmental effects The use of chlorine in disinfectants leads to the production of chloroform while bulk products PVC contribute to the production of chlorinated dibenzo p dioxins and dibenzofurans when they are burned Those against argue that chlorine and many chlorinated compounds are essential in the control of human health the prevention of disease transmitted through drinking water that has not been disinfected and that chlorinated compounds are indispensable intermediates in many production processes representing a vast economic value But such discussions often ignore the fact that Nature contributes significantly to the production of chlorinated organic compounds More than 1000 such compounds are known and their contribution to the biogeochemical cycling of chlorine is underestimated Chlorine is organically bound in large quantities to humic materials and natural production mechanisms are known for low molecular weight compounds methyl chloride chloroform chlorinated dibenzo p dioxins and dibenzofurans The role of these compounds in the environment is largely unknown Naturally Produced Organohalogens gives a complete overview of the present state of knowledge on the subject giving a much needed balance to the argument sketched out above

**The Near-Surface Layer of the Ocean** Alexander Soloviev, Roger Lukas, 2006-03-13 Until the 1980s a tacit agreement among many physical oceanographers was that nothing deserving attention could be found in the upper few meters of the ocean The lack of adequate knowledge about the near surface layer of the ocean was mainly due to the fact that the widely used oceanographic instruments such as bathythermographs CTDs current meters etc were practically useless in the upper few meters of the ocean Interest in the near surface layer of the ocean rapidly increased along with the development of remote sensing techniques The interpretation of

ocean surface signals sensed from satellites demanded thorough knowledge of upper ocean processes and their connection to the ocean interior. Despite its accessibility to the investigator the near surface layer of the ocean is not a simple subject of experimental study. Random sometimes huge vertical motions of the ocean surface due to surface waves are a serious complication for collecting quality data close to the ocean surface. The supposedly minor problem of avoiding disturbances from ships wakes has frustrated several generations of oceanographers attempting to take reliable data from the upper few meters of the ocean. Important practical applications nevertheless demanded action and as a result several pioneering works in the 1970s and 1980s laid the foundation for the new subject of oceanography the near surface layer of the ocean.

**Abstracts of the Second International Symposium on Gas Transfer at Water Surfaces**, 1990      **Discovering the Ocean from Space** Ian S. Robinson, 2010-08-12 This book offers a survey of the contribution of satellite data to the study of the ocean focusing on the special insights that only satellite data can bring to oceanography. Topics range from ocean waves to ocean biology spanning scales from basins to estuaries. Some chapters cover applications to pure research while others show how satellite data can be used operationally for tasks such as pollution monitoring or oil spill detection.

**Approaches to Scaling of Trace Gas Fluxes in Ecosystems** A.F. Bouwman, 1999-02-23 This excellent book covers techniques used for extrapolating measurements of trace gas fluxes and factors regulating the production, consumption and exchange of trace gases in terrestrial and aquatic environments. It provides a comprehensive summary of all aspects of scaling from flux measurement techniques, geographic data modelling, use of tracers and isotopes, inverse modelling and satellite borne atmospheric observations. An interesting feature of the book is the fact that both fluxes from terrestrial and aquatic marine sources are discussed along with the uncertainties in estimates of trace gas fluxes at different scales including point, field, landscape, regional and global scale. As well as reviewing the state of the art in the field of scaling of fluxes of greenhouse gases, ozone and aerosol and their precursors and acidifying compounds, the emphasis of this volume is on identification of gaps in knowledge, finding solutions and determination of future research directions.      [Oceanography and Marine Biology, An Annual Review](#) Alan Ansell, R. N. Gibson, Margaret Barnes, 1999-11-25 *Oceanography and Marine Biology, An Annual Review* considers basic areas of marine research returning to them when appropriate in future volumes and deals with subjects of special and topical importance in the field of marine biology. The thirty seventh volume follows closely the objectives and style of the earlier well received volumes continuing to regard marine sciences with all their various aspects as a unit. Physical, chemical and biological aspects of marine science are dealt with by experts actively engaged in their own field. The series is an essential reference text for research workers and students in all fields of marine science and related subjects and is consistently among the highest ranking impact factors for the marine biology category of the citation indices compiled by the Institute for Scientific Education.
