New Concepts in AIDS Pathogenesis Luc Montagnier, Marie-Lise Gougeon, 1993-08-02 This resource offers comprehensive explanations of current theories on the pathogenesis of AIDS examining in detail current data on the role that HIV and its possible cofactors play in the decline of immune system function and the progressive depletion of T lymphocytes Information is provided on mycoplasmas a potentially critical component in virus replication and immune activation Revealing research studies in support of the theoretical approaches presented this volume updates the mechanisms of HIV latency and activation of expression at both the viral and cellular levels in the human and primate systems emphasizes the role of cytokines in the dysfunction of the immune and central nervous systems describes the mechanisms of immune activation that result in anergy and programmed cell death involving the viral external glycoprotein and possible other foreign antigens or superantigens and explicates original hypotheses on pathogenesis where virus glycoproteins may mimic allogenic stimulation and disturb the immune system network This reference is intended for immunologists infectious disease specialists microbiologists virologists molecular and cell biologists parasitologists and pathologists *Cumulated Index Medicus*, 1993 **Advances in Immunology**, 1996-10-21 Praise for the Series The series which all immunologists need The Pharmaceutical Journal Advances in Immunology must find itself among the most active volumes in the libraries of our universities and institutions Science Deserves a permanent place in biomedical libraries as an aid in research and in teaching Journal of Immunological Methods Key Features The role of CD40 and its ligand gp39 as central players in the regulation of B cell growth and differentiation Prolactin growth hormone and insulin like growth factor I as full fledged immunological growth and differentiation factors Transcription factors of functionally mutant mice are highly relevant to understanding hemopoiesis and B cell genesis in vivo HIV infection of xenotransplanted mice compared with natural HIV and SIV infections The expression and role of cytokines in Rheumatoid Arthritis and in seronegative arthritis The functions of the surrogate light chain in B cell development Mechanisms that regulate cytokine activity and the generation and function of sCR as cytokine antagonists and or cytokine carriers in vivo Potential transducing molecules involved in signaling processes and which mark the difference between signaling through IL 2R and IL 4R National Library of Medicine Current Catalog National Library of Medicine (U.S.), 1993 *In vivo Models of HIV Disease and Control* Herman Friedman, Steven Specter, Mauro Bendinelli, 2007-04-27 An AIDS vaccine is still elusive and HIV treatment continues to develop multidrug resistance at alarming rates Because of the similarities between HIV and immune deficiency infections in a variety of animals it is only natural that scientists use these animals as models to study pathogenesis treatment vaccine development and many other aspects of HIV Part of the series Infectious Agents and Pathogenesis this volume reviews the immune deficiency virus in a variety of hosts Pathogenesis vaccine and drug development epidemiology and the natural history of the monkey mouse cat cow horse and other animal viruses are detailed and compared to HIV Also included are chapters on the history and future of

Seizures Norman Delanty, 2001-11-27 Seizures are frightening events They frighten the patients who experience them they frighten those who witness them they also frighten many physicians who have to deal with them Most individuals with seizures present to family physicians or to emergency room physicians However despite the fact that seizures are among the most common neurological conditions most general practitioners family practice specialists and internists do not see large numbers of patients with seizures Given the apoplectic appearance of generalized tonic clonic convulsions it is not difficult to understand why they arouse such emotional responses in those that experience them those that witness them and those

whose care is sought for them Seizures are symptoms of something wrong with the brain Many different kinds of perturbations in brain anatomy chemistry or physiology can produce seizures For many individuals seizures occur in the context of an acute illness and will not recur once that illness is treated These individuals do not have epilepsy They have transient disturbances in brain function attributable to systemic medical conditions It is important to recognize these issues because first the seizure may be the initial or even only manifestation of the underlying medical problem and this needs to be recognized
