

# Coarse-grained Rocks

## Granite

*A very common rock, makes up much of the Sierra Nevada*

- Hard; not typically scratched with a pocket knife
- Dense and coarse-grained with a mottled coloration; gray, yellow, brown, pink, and black
- Contains large, angular, embedded crystals, ranging from glassy to nearly metallic
- Easily found across the state, but particularly prevalent in the Sierra Nevada and on the coast

How are they different?

Granite is lighter in color than diorite and much more common

## Diorite

*A common volcanic rock that resembles granite*

- Hard; not typically scratched with a pocket knife
- Dense and coarse-grained with a mottled coloration; black, gray, brown and white
- Contains fewer light-colored mineral grains or masses than granite
- Much of the state's diorite is found in the Klamath Mountains and the northern Sierra Nevada

How are they different?

Diorite is coarser grained and contains more light-colored grains than diabase

## Diabase

*A dark, dense, medium-grained volcanic rock*

- Hard; not typically scratched with a pocket knife
- Dark in color with medium-sized mineral grains, some of which may appear glassy
- Contains small embedded light-colored crystals, sometimes clustered together
- The northern third of the state, particularly in the Klamath Mountains, will yield diabase

How are they different?

Gabbro is much coarser grained and contains much larger embedded crystals

## Gabbro

*An uncommon dark greenish coarse-grained volcanic rock*

- Hard; not typically scratched with a pocket knife
- Dark color, typically nearly black and often with a greenish tint; may contain lighter crystals
- Contains large embedded rectangular crystals that are often very reflective or glassy
- The Klamath Mountains and northern portions of the Sierra Nevada Range produce gabbro

# Coarse-grained Rocks

## Porphyry

*Uncommon rocks containing large, very conspicuous crystals*

- Fairly hard, may be scratched with a pocket knife
- Can resemble granite, basalt, or rhyolite, but has well-formed angular crystals embedded within it
- Crystals are often lighter colored and are conspicuous, appearing "out of place"
- Most common in mountainous regions, such as the northwest and northeast

How are they different?

Porphyry contains crystals of fairly uniform size and shape embedded in hard rock

## Conglomerate and Breccia

*Fairly common rocks consisting of smaller rocks stuck together*

- Both rocks vary greatly in hardness
- Conglomerate is a rock consisting of small rounded stones cemented together
- Breccia is similar, but consists of broken, angular rock fragments cemented together
- Both are common on the Pacific Coast, particularly the Coastal Ranges north of Santa Barbara

How are they different?

Sandstone is much more even-grained than either conglomerate or breccia

## Sandstone

*One of the most common sedimentary rocks*

- Soft; can be scratched with a pocket knife
- Composed of cemented sand, so it has a coarse, gritty, sandy texture; sometimes crumbly
- Typically light-colored, but often with darker-colored layers or bands
- Sandstone covers much of the state; look along the Pacific Coast and in southern desert areas

How are they different?

Sandstone is coarser and more widespread, tuff often contains glass fragments

## Tuff

*A common rock composed of compacted volcanic ash*

- Ranges in hardness; often fairly soft
- Light gray to brown in color, often with dark spots; finer grained, sometimes glassy
- Frequently contains small fragments of dark volcanic glass (obsidian) embedded within it
- The volcanic far northeastern corner of the state, as well as the area along the Nevada border, yield tuff
