**REALGAR**

**An important ore of arsenic,** realgar is bright red or orange in color. Crystals are not often found, but when they occur they are short, prismatic, and striated. Realgar mostly occurs as coarse to fine granular masses and as encrustations. Realgar disintegrates on prolonged exposure to light, forming an opaque yellow powder, which is principally pararealgar. Therefore, specimens are kept in darkened containers.

Realgar is typically found in hydrothermal deposits at low temperature (up to 400°F/200°C) often with orpiment (p.59) and other arsenic minerals. It also forms as a sublimate around volcanoes, hot springs, and geyser deposits and as a weathering product of other arsenic-bearing minerals. Realgar is often found with stibnite (p.61) and calcite (p.114).

**Powdered realgar**

Scarlet to orange-yellow in color, powdered realgar was once used as a pigment and in fireworks.
