Natural Phenomena Changing Coastlines Natural Phenomena:

Climate Change and Maritime Boundaries Snjólaug Árnadóttir, 2021-12-09 Coastal States exercise sovereignty and sovereign rights in maritime zones measured from their coasts. The limits to these maritime zones are bound to recede as sea levels rise and coastlines are eroded. Furthermore, ocean acidification and ocean warming are increasingly threatening coastal ecosystems which States are obligated to protect and manage sustainably. These changes accelerating as the planet heats prompt an urgent need to clarify and update the international law of maritime zones. This book explains how bilateral maritime boundaries are established and how coastal instability and vulnerable ecosystems can affect the delimitation process through bilateral negotiations or judicial settlement and engages with core concepts within public international law to address emerging issues such as diminishing territory and changing boundaries. She proposes viable ways of addressing future challenges and sets out how fundamental changes to the marine environment can justify termination or revision of settled maritime boundaries and related agreements.

Impact of Ocean Forcing on the Coastal Hydrology, Environment and Freshwater Resources Tianyuan Zheng, Chengji Shen, Xiuyu Liang, Olaf Kolditz, Guangquan Chen, 2024-10-24 Groundwater is a valuable source of freshwater in coastal areas. The groundwater flux in coastal aquifers generally occurs in two processes: seawater intrusion (SWI) and submarine groundwater discharge (SGD). SWI, the subsurface movement of seawater into freshwater aquifers, is a natural phenomenon in coastal areas. As a result of SWI, the salinity of groundwater in the aquifer increases, thereby reducing the availability of freshwater in coastal areas. The total efflux, including fresh groundwater and circulating seawater to the sea, is commonly referred to as SGD. SGD is an important source of freshwater, nutrients, metals and carbon to the ocean, thereby affecting coastal water quality and ecosystems. The study of the hydrological behaviors of these two processes in coastal aquifers is beneficial for the sustainable management of marine and groundwater resources in coastal areas.
