

Math 103 section 006 extra credit assignment

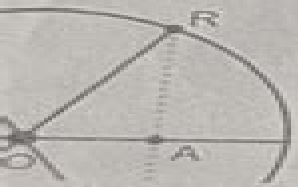

Cutting a pie into six pieces is harder than four or eight, but there is a trick to it that's simple enough if you're good at dividing things in two. First, cut the pie in half. Then mark the center of the pie (center of the diameter). splitting the big cut into two radii. Then you cut each radius in half.

From here, you draw two lines perpendicular to the midpoints of the radii. Where these lines intersect the edge of the pie, is where you make your other cuts (see bottom two diagrams). Each cut should go through the center, and straight to the opposite side. If this is done correctly, there should be six even pieces.

For the rest of the points of this assignment, I want you to explain why this trick works. This will be through a couple of questions guiding you through it.

Question 1. In the diagram below, I labelled the center of the pie O , and two parts of the top-right slice A and R . Assuming the pie has a diameter of 12 inches, determine two of the sides of the triangle $\triangle OAR$, and use a trigonometric relation to find the angle of the top-right slice.

Question 2. Find the angles of the other slices to verify they are all equal. Symmetry will give you four of the other slices, but the very top and bottom slice need their own verification (Hint: use the fact that angles along a straight line add to 180 degrees or π radians.)
