Pricing Convertible Bonds:

The Handbook of Convertible Bonds Jan De Spiegeleer, Wim Schoutens, 2011-07-07 This is a complete guide to the pricing and risk management of convertible bond portfolios Convertible bonds can be complex because they have both equity and debt like features and new market entrants will usually find that they have either a knowledge of fixed income mathematics or of equity derivatives and therefore have no idea how to incorporate credit and equity together into their existing pricing tools Part I of the book covers the impact that the 2008 credit crunch has had on the markets it then shows how to build up a convertible bond and introduces the reader to the traditional convertible vocabulary of yield to put premium conversion ratio delta gamma vega and parity The market of stock borrowing and lending will also be covered in detail Using an intuitive approach based on the Jensen inequality the authors will also show the advantages of using a hybrid to add value pre 2008 many investors labelled convertible bonds as investing with no downside there are of course plenty of 2008 examples to prove that they were wrong The authors then go on to give a complete explanation of the different features that can be embedded in convertible bond Part II shows readers how to price convertibles It covers the different parameters used in valuation models credit spreads volatility interest rates and borrow fees and Maturity Part III covers investment strategies for equity fixed income and hedge fund investors and includes dynamic hedging and convertible arbitrage Part IV explains the all important risk management part of the process in detail This is a highly practical book all products priced are real world examples and numerical examples are not limited to hypothetical convertibles It is a must read for anyone wanting to safely get into this highly liquid high return market Convertible Bond Valuation and Pricing Marc A. Shivers, 2003

Valuation of Convertible Bonds when Investors Act Strategically Christian Koziol, 2012-12-06 The large volume of literature on convertible bonds addresses two basic complexes of problems Why and under which conditions do firms issue convertible bonds What is the fair value of a convertible bond Christian Koziol's dissertation deals with the second problem His dissertation differs from the predominant part of the literature in two aspects First he explicitly considers the strategic character of the conversion decision as the timing and the volume of conversion affect the wealth of the stockholders and the remaining convertible bond holders Second he deals with a more general capital structure where the firm has subordinated debt outstanding in addition to convertible bonds and stocks Within this setting he characterizes and analyzes the optimal conversion strategy and the endogenous prices of convertible bonds stocks and the additional debt for three cases all convertible bonds are held by a monopolist the convertible bond holders act competitively and the competitive bond holders are constrained to convert their bonds in one block The third variant is typical for the option theoretic valuation of convertible bonds that uses the typical high contact condition for American options Pricing Convertible Bonds Kevin B. Connolly, 1998 **Pricing Convertible Bonds by Simulation** Ali Bora Yigitbasioglu, 2006 Convertible bonds are complex hybrid securities subject to multiple sources of risk Many exhibit exotic path dependent features Monte Carlo method is

usually the favorite choice for solving high dimensional problems and pricing path dependent securities This paper breaks away from the tradition established in the literature of pricing convertible bonds with finite difference and lattice methods and suggests a simulation methodology for convertible bond pricing We introduce the dividend process for convertible bonds and formulate the pricing problem according to the probabilistic martingale approach The proposed methodology deals with convertible bonds subject to credit risk with call and put features The early exercise rules are estimated by means of least squares regressions as in Longstaff and Schwartz 2001 The accuracy of the simulation algorithm is tested in the context of a two factor model The algorithm performs fairly well and shows potential for further extension to include many complexities inherent in convertible bonds as well as additional risk factors

Convertible Securities Montgomery Rollins, 1913

Three Essays on the Pricing of Convertible Bonds and on Put-call Parities Yuriy Zabolotnyuk, 2009 This thesis is a collection of three papers that have the valuation of derivative securities as a common theme The first paper

empirically compares three convertible bond valuation models We use an innovative approach where all model parameters are estimated by the Marquardt 1963 algorithm using a subsample of convertible bond prices The model parameters are then used for out of sample forecasts of convertible bond prices The mean absolute deviation which is calculated as the absolute difference between the model and the market price and expressed as a percentage of the market price is 1 70% for the Ayache Forsyth Vetzal 2003 model 1 74% for the Tsiveriotis Fernandes 1998 model and 2 12% for the Brennan Schwartz 1980 model For this and other measures of fit the Ayache Forsyth Vetzal and the Tsiveriotis Fernandes models outperform the Brennan Schwartz model The second paper examines the market memory effect in convertible bond markets More specifically we look at the pricing of convertible bonds issued after the original issuer adversely redeemed previous issues without giving an opportunity for investors to benefit from bond value appreciation We find evidence that the market underprices new convertible bond issues of firms that call their bonds early We also find that the degree of market underpricing depends on whether the convertibles are more debt or equity like In the third paper the European put call parity condition is used to estimate the early exercise premium for American currency options traded on the Philadelphia Stock Exchange Using a sample of 331 pairs of call and put options with the same exercise price and time to expiration we find that the early exercise premium on average is 5 03% for put options and 4 60% for call options The premia for both call and put options are strongly related to the interest rate differential and time to expiration These results are important to consider when valuing American currency options using European option pricing models
