estacionarias para generación de energía eléctrica. Su objetivo básico es cubrir las necesidades bibliográficas para el seguimiento de las asignaturas Ingeniería y Máquinas Térmicas y Ampliación de Motores Térmicos que se imparten en las escuelas de ingeniería industrial. Asimismo pretende ofrecer una visión horizontal de las diferentes partes y subsistemas que conforman la máquina alternativa de combustión interna. Los tres primeros capítulos introducen al lector en la problemática de la transformación de energía desde una fuente primaria hasta su forma final en trabajo mecánico en un eje de rotación. En los capítulos siguientes se analizan los aspectos concretos de la máquina alternativa que nos ocupa que, dado su funcionamiento pulsante, se estructuran en una fase cerrada en la que el volumen del cilindro está cerrado al exterior y se desarrollan los procesos para la generación de trabajo: compresión, aportación de calor y expansión, y una fase abierta en la que el volumen del cilindro está abierto al exterior para realizar los procesos de renovación de la carga. Ambas fases se dan tanto en los motores de encendido por compresión (MEC) como en los de encendido por chispa (MEP). Los capítulos finales ofrecen una visión mecánica del mecanismo transformador utilizado en los que se describe su arquitectura mecánica y el detalle de su funcionamiento.
