**Exploring Cancer Metabolic Reprogramming through Molecular Imaging** Franca Podo, Zaver M. Bhujwalla, Egidio Iorio, 2017-07-27 The inclusion of oncogene driven reprogramming of energy metabolism within the list of cancer hallmarks Hanahan and Weinberg Cell 2000 2011 has provided major impetus to further investigate the existence of a much wider metabolic rewiring in cancer cells which not only includes deregulated cellular bioenergetics but also encompasses multiple links with a more comprehensive network of altered biochemical pathways This network is currently held responsible for redirecting carbon and phosphorus fluxes through the biosynthesis of nucleotides amino acids lipids and phospholipids and for the production of second messengers essential to cancer cells growth survival and invasiveness in the hostile tumor environment The capability to develop such a concerted rewiring of biochemical pathways is a versatile tool adopted by cancer cells to counteract the host defense and eventually resist the attack of anticancer treatments Integrated efforts elucidating key mechanisms underlying this complex cancer metabolic reprogramming have led to the identification of new signatures of malignancy that are providing a strong foundation for improving cancer diagnosis and monitoring tumor response to therapy using appropriate molecular imaging approaches In particular the recent evolution of positron emission tomography PET magnetic resonance spectroscopy MRS spectroscopic imaging MRSI functional MR imaging fMRI and optical imaging technologies combined with complementary cellular imaging approaches have created new ways to explore and monitor the effects of metabolic reprogramming in cancer at clinical and preclinical levels Thus the progress of high tech engineering and molecular imaging technologies combined with new generation genomic proteomic and phosphoproteomic methods can significantly improve the clinical effectiveness of image based interventions in cancer and provide novel insights to design and validate new targeted therapies The Frontiers in Oncology Research Topic Exploring Cancer Metabolic Reprogramming Through Molecular Imaging focusses on current achievements challenges and needs in the application of molecular imaging methods to explore cancer metabolic reprogramming and evaluate its potential impact on clinical decisions and patient outcome A series of reviews and

perspective articles along with original research contributions on humans and on preclinical models have been concertedly included in the Topic to build an open forum on perspectives present needs and future challenges of this cutting edge research area     Epigenetics In Human Reproduction And Development Anna K Naumova, Teruko

Taketo-hosotani, 2016-12-20 Epigenetics is defined as heritable changes that do not affect the DNA sequence but influence gene expression Epigenetic changes occur at the levels of DNA histone protein and chromatin structures Proper epigenetic modifications are essential for cell differentiation and function during development while some epigenetic modifications are passed on from parents to offspring through gametes Therefore alterations of epigenetic states would have serious consequences for human development and health This realization and the advent of new technologies have encouraged the advance of epigenetic studies in recent years Nonetheless many aspects of epigenetics such as regulatory mechanisms and evolutionary advantages remain to be better understood Written by 26 scientists at the forefront of epigenetics research this book discusses the different facets of epigenetics from gametogenesis to child development as well as from mechanistic studies in animal models to reviews of human clinical data     **Lipid Polymorphism and Membrane Properties**

, 1997-10-02 The major lipid components of biological membranes can undergo many diverse and fascinating morphological rearrangements Studies of these diverse phases and the manner in which they are formed tends to alter the properties of ordinary bilayer membranes This book examines the structural and biological roles of lipids forming non lamellar structures Key Features Characterization of non lamellar structures Protein activity and membrane properties Analysis of membrane fusion Affect of non lamellar forming lipids on biological systems     **Arachidonate Remodeling and Inflammation** Alfred N. Fonteh, Robert L. Wykle, 2012-12-06 Arachidonic acid AA and other 20 or 22 carbon polyunsaturated fatty acids PUFAs are precursors of lipid mediators of inflammation known as eicosanoids These mediators are critical in disease processes and in regulating normal cell function Remodeling is important in maintaining homeostasis and in regulating cell function by dictating how PUFAs are converted to lipid mediators of inflammation Thus PUFA remodeling is a critical process in the biosynthesis of a multitude of mediators and understanding this process will unravel better therapeutic targets for controlling inflammatory diseases such as asthma and Alzheimer s disease AA metabolism is described in an integrated context linking the remodeling processes with the biosynthesis of mediators and diseases By following the movement of the substrate AA the volume describes how upstream biosynthetic pathways influence the formation of lipid mediators of inflammation showing the metabolic interrelationship between all AA derived mediators     *Biomedical Index to PHS-supported Research* , 1991     *Chromatography of Lipids in Biomedical Research and Clinical Diagnosis A.*

Kuksis, 1987-01-01 This multi author volume provides an unprecedented in depth coverage of the separation identification and quantitation of simple and complex food and tissue fats and other lipids by chromatographic and mass spectrometric methods with emphasis on applications to biomedical research and clinical diagnosis It contains a total of 13 chapters written

by scientists who are internationally recognized in their specific fields The volume covers analyses of molecular species of eicosanoids sterols and glycerol and glycolipids in healthy and diseased human tissues and in appropriate animal models The text complements the simpler group determinations of lipid classes commonly employed in clinical laboratories The volume anticipates the discovery of the specific metabolism of molecular species of complex glycerolipids and provides the medical researcher and clinical investigator with the means for dealing with it

**Control of Membrane Function: short-term and long-term** J.M. Ritchie, P. Magistretti, L. Bolis, 2012-12-02 A critical factor in cell to cell interactions is the presence in the cell membrane of highly specific ion channels controlled by specific receptors that are bound to and activated by a gamut of external hormones and neurotransmitters Through both this action on ion channels and action on other membrane components such as G proteins extracellular signals alter intracellular events usually through the mediation of second messengers and so provide the basis for the transduction mechanism connecting extracellular signals with intracellular effectors This volume deals with the various ways that such membrane function is controlled
