

industry, and the role of conservation education (the niche of this book) and a review of Polynesian cultural values that are stimulating new assessments of the island environment.

Culliney's *Islands in a Far Sea* is more a substantial narrative than a resource book. Chapters focus on Hawaiian ecosystems (marine, lowland, freshwater, montane) and associated biota; evolutionary history, ecology, history of human impacts, and current status are explored in language suitable for the non-scientist but with enough rich detail to satisfy a biologist. References from the scientific literature are thorough, current, and well chosen.

Both books survey the unparalleled diversity of Hawaiian life, from the well known (the spectacular radiations of endemic honeycreepers, tree snails, lobelioid forest plants, and drosophilid flies) to the obscure (the small fish and invertebrates climbing thousands of feet up rushing streams and waterfalls to breed in fresh water, or the endemic insects of lava tubes, recently evolved from surface forms). Both also tell of the overwhelming impact of European colonization and exploitation; the frontier-conquering spirit that devastated Laysan Island, for example, has the resonance of a Wild West setting. More surprising is the evidence of massive ecological disruption by the Polynesians—agricultural clearing, huge irrigation works, and the relentless killing of native birds for feathers all refute the idea of a gentle people living in perfect harmony with a benign environment.

Even more saddening are the examples of the destruction of native biota during a period (1960 to the present) when Hawaii's uniqueness has been well understood and conservation has been of public concern. Culliney saves his harshest words for developers and state agencies who are making decisions with irreparable consequences. For example, the importation of non-native ungulates and their maintenance as a game resource in vulnerable native forests has been allowed or even encouraged by state agencies, despite direct conflict with critically endangered forest birds and high-elevation plants. Recent development of coastal resorts has destroyed a major fraction of known anchialine systems, brackish pools supporting a fragile and unique community of invertebrates, only recently described and not yet well understood. Similarly, astronomical and other activity on Mauna Kea's summit is destroying another unique and scarcely known ecosystem; a complex group of invertebrates survives there as aeolian scavengers on whatever insects are blown to the summit from lower elevations. The primary threats to Hawaiian nature (habitat

destruction, introduced diseases, non-native predators and grazers) are dealt with thoroughly.

Scientific expertise is badly needed to provide a basis for conservation decisions. The entire genus *Archaeobutleria*, comprising the diverse tree snails of Oahu, has been listed federally as endangered for seven years; at least half the species are extinct and the others are succumbing to an introduced carnivorous snail, but no recovery plan has yet been written. Similarly, huge efforts are dedicated to captive propagation and releases of the Hawaiian goose, the nene, but there is no understanding of why released birds fail to reproduce.

The third book, *Islands of Life*, was produced by the Nature Conservancy, with proceeds to go toward land preservation in the islands. The title refers both to the

archipelago and to the preserves and fragments of natural areas painstakingly acquired—or yet to be established. The text is brief and is lyrical rather than technical—only Hawaiian or common names are used, and the threats to Hawaii are mentioned rather than dwelt upon. The photography is a stunning evocation of the beauty of native Hawaiian landscapes and life forms. It is certain to create a desire to see firsthand these places and unique beings; the loving photography of pristine Hawaii, however, will not prepare first-time visitors for the unlikelihood of seeing native birds or native forest without deliberate effort to get away from tourist locations.

Hawaii's story is a melancholy one, of finite island ecosystems and the irrevocable damage caused by introduced predators, plants, and disturbance; of the loss of the chance to study evolutionary patterns richer than those of the Galapagos; and worst, of the replacement of the unique by the woody, so that a visit to Oahu might be a visit to any densely populated tropical area—Bermuda, Mexico, Asia. The message of these books is not defeatist, but a call for acknowledgment and preservation of what remains of Hawaii's uniqueness. Those who call for halts to tropical deforestation or who desire to contribute to the scientific basis of conservation efforts might do well to focus their expertise on the Hawaiian biota, whose evolutionary complexity is unrivaled and whose plight is as desperate as that of any tropical assemblage.

Phylogenetic Relationships of the Lizard Families. Essays Commemorating Charles L. Camp. RICHARD ERTES and GREGORY FRIGGILL, Eds. Stanford University Press, Stanford, CA, 1988. xvi, 631 pp., illus. \$80. Based on a symposium, Knoxville, TN, Dec. 1982.

One of the greatest scientific enterprises is the attempt to understand how the biosphere came to be as it is. To pursue this goal, we need to know how organisms, both previous and present, are genealogically related to each other. Such a map of the past, even if incomplete and not entirely accurate, is essential if we are to consider such questions as whether there are regularities in the way things evolve and, if so, what factors have been responsible for restricting change to produce such patterns. Attempts to devel-

op such schemes of relationship—phylogenies—have been made since the appearance of the *Origin of Species* but fell from favor in English-speaking countries about 60 years ago. Renewed interest came with the 1966 translation of Willi Hennig's *Phylogenetic Systematics*. This was a much-expanded version of a book originally published in 1950. In fact some of the ideas that this second edition contained were already available in English. For instance, Paul Maslin had discussed how to recognize primitive and derived states of taxonomic characters in 1952. But it is an oddity of intellectual advance that a long, obscure text, preferably translated from another language, often has proportionally more effect than concise and lucid accounts.

Hennig's methods, which were subse-
