**Apoptosis and Beyond, 2 Volume Set** James A. Radosevich, 2018-12-27 These volumes teach readers to think beyond apoptosis and describes all of the known processes that cells can undergo which result in cell death This two volume source on how cells dies is the first comprehensive collection to cover all of the known processes that cells undergo when they die It is also the only one of its kind to compare these processes It seeks to enlighten those in the field about these many processes and to stimulate their thinking at looking at these pathways when their research system does not show signs of activation of the classic apoptotic pathway In addition it links activities like the molecular biology of one process eg Necrosis to another process eg apoptosis and contrasts those that are close to each Volume 1 of Apoptosis and Beyond The Many Ways Cells Die begins with a general view of the cytoplasmic and nuclear features of apoptosis It then goes on to offer chapters on targeting the cell death mechanism microbial programmed cell death autophagy cell injury adaptation and necrosis necroptosis ferroptosis anoikis pyronecrosis and more Volume 2 covers such subjects as phenoptosis pyroptosis hematopoiesis and eryptosis cyclophilin d dependent necrosis and the role of phospholipase in cell death Covers all known processes that dying cells undergo Provides extensive coverage of a topic not fully covered before Offers chapters written by top researchers in the field Provides activities that link and contrast processes to each other Apoptosis and Beyond The Many Ways Cells Die will appeal to students and researchers clinicians in cell biology molecular biology oncology and tumor biology

Martonosi, 2012-12-06 In the first edition of *The Enzymes of Biological Membranes* published in four volumes in 1976 we collected the mass of widely scattered information on membrane linked enzymes and metabolic processes up to about 1975 This was a period of transition from the romantic phase of membrane biochemistry preoccupied with conceptual developments and the general properties of membranes to an era of mounting interest in the specific properties of membrane linked enzymes analyzed from the viewpoints of modern enzymology The level of sophistication in various areas of membrane research varied widely the structures of cytochrome c and cytochrome b5 were known to atomic detail while the majority of membrane linked enzymes had not even been isolated In the intervening eight years our knowledge of membrane linked enzymes expanded beyond the wildest expectations The purpose of the second edition of *The Enzymes of Biological Membranes* is to record these developments The first volume describes the physical and chemical techniques used in the analysis of the structure and dynamics of biological membranes In the second volume the enzymes and metabolic systems that participate in the biosynthesis of cell and membrane components are discussed The third and fourth volumes review recent developments in active transport oxidative phosphorylation and photosynthesis *The Chemotherapy of Protozoan Diseases* Edgar Alfred Steck, 1972 *Blumgart's Surgery of the Liver, Biliary Tract and Pancreas, 2-Volume Set - E-Book* William R. **Methods in Membrane Biology** Edward D. Korn,2012-12-06 Three articles make up Volume 10 of Methods in Membrane Biology In the first of these Papahadjopoulos Poste and Vail extensively review much of the available data on the fusion of natural membranes model membranes liposomes and natural membranes with liposomes The authors are led by their review of the experimental methods and their interpretations of the results obtained to a general theory of membrane fusion which they believe is applicable to all systems that have been studied Arguing that although protein and carbohydrate may serve in some cases to bring membranes into sufficiently close proximity for fusion to occur and in other cases to remove peripheral and integral proteins from the regions that are to undergo fusion the authors conclude that membrane fusion per se is solely a property of the lipid bilayer In their view all the experimental observations to date can be subsumed under a unifying hypothesis in which membrane fusion is the result of a phase separation in one half of the membrane bilayer brought about by the interaction of calcium ions with acidic phospholipids mostly phosphatidylserine Where half membranes already contain sufficient acidic phospholipids a local increase in calcium ion concentration may suffice to induce fusion examples might include exocytosis and fusion of intracellular membrane systems In other cases natural or experimentally induced events preceding fusion might be necessary to increase the local concentration of the acidic phospholipids in the half membrane virus or fusogenic agent induced cell to cell fusion or endocytosis for example
