Tamura, 1990-01-19 Six contributors from Japanese universities explore the basic theory and methodology of control and decision making in systems that either contain many variables or have some special characteristics such as multiple subsystems or control stations a decentralized and or hierarchical information structure **Stability of Dynamical Systems** Anthony N. Michel, Ling Hou, Derong Liu, 2008 Filling a gap in the literature this volume offers the first comprehensive analysis of all the major types of system models Throughout the text there are many examples and applications to important classes of systems in areas such as power and energy feedback control artificial neural networks digital signal processing and control manufacturing computer networks and socio economics Replete with exercises and requiring basic knowledge of linear algebra analysis and differential equations the work may be used as a textbook for graduate courses in stability theory of dynamical systems The book may also serve as a self study reference for graduate students researchers and practitioners in a huge variety of fields **Qualitative Methods in Nonlinear Dynamics** A.A. Martynyuk, 2001-11-05 Presents new approaches to qualitative analysis of continuous discrete time and impulsive nonlinear systems via Liapunov matrix valued functions that introduce more effective tests for solving problems of estimating the domains of asymptotic stability **Stability and Control of Dynamical Systems with Applications** Derong Liu, Panos J. Linear Systems Panos J. Antsaklis, Anthony N. Michel, 2005-10-27 There are three words that characterize this work thoroughness completeness and clarity The authors are congratulated for taking the time to write an excellent linear systems textbook The authors have used their mastery of the subject to produce a textbook that very effectively presents the theory of linear systems as it has evolved over the last thirty years The result is a comprehensive complete and clear exposition that serves as an excellent foundation for more advanced topics in system theory and control IEEE Transactions on Automatic Control In assessing the present book as a potential textbook for our first graduate linear systems course I find that Antsaklis and Michel have contributed an expertly written and high quality textbook to the field and are to be congratulated Because of its mathematical sophistication and completeness the present

book is highly recommended for use both as a textbook as well as a reference Automatica Linear systems theory plays a broad and fundamental role in electrical mechanical chemical and aerospace engineering communications and signal processing A thorough introduction to systems theory with emphasis on control is presented in this self contained textbook The book examines the fundamental properties that govern the behavior of systems by developing their mathematical descriptions Linear time invariant time varying continuous time and discrete time systems are covered Rigorous development of classic and contemporary topics in linear systems as well as extensive coverage of stability and polynomial matrix fractional representation provide the necessary foundation for further study of systems and control Linear Systems is written as a textbook for a challenging one semester graduate course a solutions manual is available to instructors upon adoption of the text The book s flexible coverage and self contained presentation also make it an excellent reference guide or self study manual For a treatment of linear systems that focuses primarily on the time invariant case using streamlined presentation of the material with less formal and more intuitive proofs see the authors companion book entitled A Linear Systems Primer

Frequency-domain Methods for Nonlinear Analysis Gennadi? Alekseevich Leonov,Dmitri? Viktorovich

Ponomarenko,Vera B. Smirnova,1996 This book deals with the investigation of global attractors of nonlinear dynamical systems The exposition proceeds from the simplest attractor of a single equilibrium to more complicated ones i e to finite denumerable and continuum equilibria sets and further to cycles homoclinic and heteroclinic orbits and finally to strange attractors consisting of irregular unstable trajectories On the complicated equilibria sets the methods of Lyapunov stability theory are transferred They are combined with stability techniques specially elaborated for such sets The results are formulated as frequency domain criteria The methods connected with the theorems of existence of cycles and homoclinic orbits are developed The estimates of Hausdorff dimensions of attractors are presented Interdisciplinary Topics in Applied Mathematics, Modeling and Computational Science Monica G.
