

Patient Positioning Cheat Sheet

See complete guide at nurseslabs.com/positioning/

Supine (Dorsal Recumbent)

Supine position (dorsal recumbent) is wherein the patient lies flat on the back with head and shoulders slightly elevated using a pillow unless contraindicated (e.g., spinal anesthesia, spinal surgery).

Fowler's (Low, Semi, and High Fowler's)

Fowler's position, also known as **semi-sitting position**, is a bed position wherein the head of the bed is elevated 45 to 60 degrees. Variations of Fowler's position include: **low Fowler's** (15 to 30 degrees), **semi-Fowler's** (30 to 45 degrees), and **high Fowler's** (nearly vertical).

Orthopneic (Tripod)

Orthopneic or tripod position places the patient in a sitting position or on the side of the bed with an overbed table in front to lean on and several pillows on the table to rest on.

Prone

In **prone position**, the patient lies on the abdomen with head turned to one side and the hips are not flexed.

Lateral (Side-Lying)

In **lateral position**, the patient lies on one side of their body with the top leg in front of the bottom leg and the hip and knee flexed. Flexing the top hip and knee and placing this leg in front of the body creates a wider, triangular base of support and achieves greater stability.

Sim's (Semiprone)

The patient assumes a posture halfway between the lateral and the prone positions. The lower arm is positioned behind the client, and the upper arm is flexed at the shoulder and the elbow. The upper leg is more acutely flexed at both the hip and the knee, than is the lower one.
